

## ATLANTIC BLUEFIN TUNA ELECTRONIC TAGGING DATA SUMMARY

Matthew Lauretta<sup>1</sup>, Alex Hanke<sup>2</sup>, Antonio Di Natale<sup>3</sup>, Gemma Quilez Badia<sup>4</sup>

### SUMMARY

*A summary of currently available bluefin tuna electronic tagging data is provided to evaluate spatial coverage, sample sizes, and information gaps for the 2016 assessment. Data from 123 tagged bluefin tuna were compiled from databases submitted by four cooperating entities, including ICCAT GBYP, WWF Mediterranean, Canada Department of Fisheries and Oceans, and U.S. National Oceanic and Atmospheric Administration. Data are summarized by consecutive days at liberty per stock region per individual. Spatial coverage included 17 fish released in the Western Mediterranean Sea, 44 fish released near the Strait of Gibraltar, 17 fish released in the Bay of Biscay, 31 fish released in the Gulf of Mexico, nine fish released in the Gulf of St Lawrence, and five fish released in the West Atlantic. The available data represents a fraction of the electronic tags released on bluefin tuna in the Atlantic Ocean, and solicitation for additional collaboration is necessary to increase the temporal and spatial resolution of stock migration estimates.*

### RÉSUMÉ

*Un résumé des données de marquage électronique du thon rouge actuellement disponibles est fourni pour évaluer la couverture spatiale, la taille des échantillons et les lacunes en matière d'information pour l'évaluation de 2016. Les données provenant de 123 thons rouges marqués ont été compilées à partir de bases de données présentées par quatre entités coopérantes, y compris l'ICCAT-GBYP, WWF Méditerranée, le Ministère des Pêches et des Océans du Canada et la National Oceanic and Atmospheric Administration des États-Unis. Les données sont résumées par jours consécutifs en liberté par zone du stock et par spécimen. La couverture spatiale incluait 17 poissons remis à l'eau dans l'Ouest de la mer Méditerranée, 44 poissons remis à l'eau près du détroit de Gibraltar, 17 poissons remis à l'eau dans le golfe de Gascogne, 31 poissons remis à l'eau dans le golfe du Mexique, neuf poissons remis à l'eau dans le golfe du St-Laurent et cinq poissons remis à l'eau dans l'Atlantique Ouest. Les données disponibles représentent une fraction des marques électroniques déployées sur le thon rouge dans l'océan Atlantique, et il est nécessaire de solliciter une collaboration additionnelle afin d'augmenter la résolution spatiale et temporelle des estimations de la migration des stocks.*

### RESUMEN

*Se facilita un resumen de los datos de marcado electrónico de atún rojo actualmente disponibles para evaluar la cobertura espacial, los tamaños de muestra y las lagunas en la información para la evaluación de 2016. Se recopilaron los datos de 123 atunes rojos marcados de las bases de datos presentadas por cuatro entidades cooperantes, incluidas ICCAT GBYP, WWF Mediterráneo, Departamento de Pesca y Océanos de Canadá, y la Administración Nacional Oceánica y Atmosférica de Estados Unidos. Los datos se resumen por días consecutivos en libertad por región de stock y por ejemplar. La cobertura espacial incluía 17 peces liberados en el Mediterráneo occidental, 44 peces liberados cerca del estrecho de Gibraltar, 17 peces liberados en el golfo de Vizcaya, 31 peces liberados en el golfo de México, 9 peces liberados en el golfo de San Lorenzo y 5 peces liberados en el Atlántico occidental. Los datos disponibles representan una fracción de las marcas electrónicas colocadas en atunes rojos en el Atlántico y es necesario solicitar colaboración adicional para aumentar la resolución espacial y temporal de las estimaciones de la migración del stock.*

### KEYWORDS

*Atlantic bluefin tuna, satellite tags*

## **1. Introduction**

Information on stock mixing rates is essential for the development of a combined East-West stock assessment model for Atlantic bluefin tuna. Electronic tagging data provide detailed information on individual migration patterns and stock mixing rates. The bluefin tuna tagging workgroup (2015 Bluefin Data Preparatory Meeting) determined a minimum standard for submission of electronic tagging data from cooperating scientists, in preparation for the 2016 benchmark assessment. The minimum format requested was a summary of consecutive days at liberty per stock region per individual. To date, three cooperating entities have submitted data for the 2016 benchmark assessment, and include, ICCAT GBYP (GBYP), Canada Department of Fisheries and Oceans (DFO), and U.S. National Oceanic and Atmospheric Administration (NOAA). A summary of the submitted data is provided, along with the R script used to generate the data summaries from detailed track information on mean daily location in degree decimals latitude and longitude.

## **2. Materials and methods**

A call for submission of bluefin tuna electronic tagging data was made during the 2015 data preparatory meeting. Three aforementioned entities submitted data. Stock region was assigned to each individual's daily location based on a mean latitude and longitude in decimal degrees. Eight stock regions were defined during the 2015 Bluefin Data Prep Meeting and modified to 11 regions during the Species Group Meeting, shown in **Figure 1**. The coordinates of each region's boundary are listed in **Table 1**. An R script was written (**Appendix A**) to assign the stock region and aggregate individual track data into consecutive days per stock region, which was the minimum data resolution requested by the SCRS, and was deemed an acceptable format for data sharing by each of the contributing scientists. The data were compiled into a single database. Additional summaries of tag releases per stock region, distribution of days at liberty, and size structure of tagged individuals in the West Atlantic are also provided to evaluate the spatial and temporal coverage of tagged bluefin tuna, and identify potential data gaps for the 2016 assessment.

## **3. Results and discussion**

Electronic tag data for 123 bluefin tuna were compiled from three submitted databases (GBYP, DFO, and NOAA). The majority of fish were tagged and released in the Strait of Gibraltar (44 fish), Gulf of Mexico (31 fish), Western Mediterranean (17 fish) and Bay of Biscay (17 fish) (**Table 2**). The size of individuals ranged 190 to 240 cm straight fork length, with the majority of fish between 200 and 240 cm straight fork length at release (**Figure 2**). Tag duration ranged from 10 to 370 days; however, days at liberty greater than 150 days were uncommon (**Figure 3**). The compiled database (**Table 3**) provides all of the currently available electronic tagging data for the 2016 assessment, but represents a fraction of the electronic tags released on bluefin tuna in the Atlantic Ocean. Solicitation for additional collaboration is necessary to increase the temporal and spatial resolution of stock migration estimates, particularly between the East and West Atlantic regions.
