

Report of the 2023 Intersessional Meeting of the Small Tunas Species Group
(*hybrid/ Madrid (Spain), 15-18 May 2023*)

The results, conclusions and recommendations contained in this Report only reflect the view of the small tunas Species group. Therefore, these should be considered preliminary until the SCRS adopts them at its annual Plenary meeting and the Commission reviews them at its annual meeting. Accordingly, ICCAT reserves the right to comment on, to object to and/or to endorse this report, until it is finally adopted by the Commission.

1. Opening, adoption of the agenda and meeting arrangements

The meeting was held in a hybrid format between 15-18 May 2023. Constance Diaha (Côte d'Ivoire), the Species Group ("the Group") rapporteur and meeting Chair, opened the meeting and welcomed participants (The Group). Mr. Camille Manel (ICCAT Executive Secretary) welcomed the participants, noting that he was happy to report that the meeting would be held with interpreters so that discussion would be more readily understandable for non-native English speakers. The meeting's agenda was approved. The agenda is provided in **Appendix 1**, the list of participants in **Appendix 2**, the list of presentations and papers in **Appendix 3**. The authors' abstracts are provided in **Appendix 4**. Rapporteurs were assigned as follows:

Item 1.	Taylor, N.G, Neves dos Santos, M.
Item 2.	Palma, C., Mayor, C., García J., Taylor, N.G.
Item 3.	Ruben, Baibat, Davy
Item 4.	Fredou, T.
Item 5.	Guelson
Item 6.	Lino P., Constance, D, and Neves dos Santos, M.
Item 7.	Diaha, C., and Neves dos Santos, M.
Item 8.	Taylor, N.G., Neves dos Santos, M.

2. Review of fisheries statistics

The Group reviewed the most up-to-date information available in the ICCAT database system (ICCAT-DB) for the 13 major small tuna species (**Table 1**), namely the fishery statistics (T1NC: Task 1 nominal catches; T2CE: Task 2 catch & effort; T2SZ: Task 2 size frequencies of the samples) and the conventional tagging (CTAG). Detailed statistics together with various catalogues (SCRS catalogues and detailed catalogues) and dashboards to explore and analyze the information were also presented, aiming to identify data weaknesses (gaps, inconsistencies, etc.) on small tuna species for further corrections. The SCRS catalogues on Task ½ data availability for the 13 small tuna species for the period 1993 to 2022 are presented in **Appendix 5**. The 2022 information is still incomplete and preliminary. In 2021 the species DOL (*Coryphaena hippurus*) was replaced by COM (*Scomberomorus commerson*) in the official list of small tuna species, in line with *Recommendation by ICCAT on fishes considered to be tuna and tuna-like species or oceanic, pelagic, and highly migratory elasmobranchs* [Rec. 19-01].

2.1 Task 1 (catches) data and spatial distribution of catches

Task 1 nominal catch estimates (T1NC) that have been adopted by the Group for the major small tuna species by year are presented in **Table 2** (cumulative catches by species in **Figure 1**). The ICCAT Secretariat informed the Group that a few small improvements were made over the last two years on: the reduction of unclassified gears (**Figure 2**); the replacement of the preliminary SCRS estimates (carryovers and others) by official statistics (**Figure 3**) and filling data gaps through historical recoveries. The small tuna species discrimination work (e.g., KGX code for genus group *Scomberomorus spp.* now with residual catches in T1NC and ongoing work on the species split of TUN/TUS species groups codes containing some small tunas combined catches) is a long-term process involving ICCAT CPCs and the ICCAT Secretariat.

The total catch in weight of the 13 small tuna species in T1NC between 1950 and 2021 (**Table 3**) represents, on average, about 16% of the total nominal catch of all species. By decade, there was a consistent decline in weight of the small tuna species as a percentage of the total nominal catch, from 31% in the 1950s, to 13% in the 2000s, and a slow increase to about 16% in the 2020s. This evidence can have two causes: a) the increase of the catches of major tuna and sharks (including historical recoveries); b) the slight reduction on small tuna official statistics reported in the last two decades (since 2007 no more carryovers were made). Overall, small tuna catch series are still incomplete and possibly underreported. The Group reiterated the need to continue catch series recovery work by the ICCAT CPCs and the need for the Secretariat's support, using the Small Tunas SCRS catalogue as a reference (**Appendix 5**).

Of the total 13 species included in the Small Tunas Species Group, the seven most important ones represent about 92% of the total small tuna catches in 1950-2021 T1NC dataset. By descending order of importance in weight these are: BON (*Sarda sarda*) with about 33% of the total catches, LTA (*Euthynnus alletteratus*) with 14%, FRI (*Auxis thazard*) with 13%, KGM (*Scomberomorus cavalla*) and SSM (*Scomberomorus maculatus*) both with 11%, and BRS (*Scomberomorus brasiliensis*) and BLT (*Auxis rochei*) with 5% each. The other six species BLF (*Thunnus atlanticus*), MAW (*Scomberomorus tritor*), WAH (*Acanthocybium solandri*), COM (*Scomberomorus commerson*), BOP (*Orcynopsis unicolor*), CER (*Scomberomorus regalis*) represents the remaining 8% of total small tuna catches. The Species Group KGX (*Scomberomorus spp.*) has residual catches of less than 0.12% of total small tuna catches.

Following the ICCAT Methods Working Group recommendation (Anon., 2019) to study the possibility of extending the "scoring" methodology on fisheries data availability (Palma *et al.*, 2019) to small tuna species, the ICCAT Secretariat presented the updated SCRS standard scorecard with the small tuna species for the period 1992-2021 (**Table 4**). Except for FRI and LTA in the Atlantic (with scores above 5 for the ten-year time series), the other 11 cases (species/stock-area combinations) have scores below 5. This indicates Task 2 datasets (both T2CE and T2SZ) are missing for the major fisheries for which Task 1 data exist.

The Group reiterated the proposal to split FRI and LTA Atlantic region into four regions currently considered stocks/management units (the MED region shall be maintained separate for all small tuna species). The ICCAT Secretariat informed the Group that the long-term objective of geographically reallocating into billfish sampling areas all the catches reported using the historical Task 1 areas was completed in 2022. In consequence, all 13 small tuna species can now be classified into the five major regions (section 4 of ICCAT geographical definitions: https://www.iccat.int/Data/ICCAT_maps.pdf).

The ICCAT Secretariat suggested that this be done in two steps due to the complex changes required to the existing code to manage this information. The first step (short-term) will cover only the differentiation of the Atlantic and the Mediterranean catches of all small tuna species: this work has started during the meeting and will be completed in the next three weeks. The second step (mid-term) will cover the classification into the five main regions: 4 for the Atlantic and 1 for the Mediterranean. This will apply to all small tuna species with some of the species not occurring in all the five regions. This work will be completed interessionally and presented at the 2023 Meeting of the Standing Committee on Research and Statistics (SCRS). In addition, the small tunas SCRS catalogue and the SCRS small tuna scorecard will be adapted to accommodate those changes to the geographical classification of small tunas. Depending on the number of SCRS small tuna catalogues on small tunas with the new five region designations, the SCRS small tuna scores may be separated from the major tunas and sharks by creating a SCRS scorecard dedicated for small tunas.

The Group reiterated that small tuna fisheries statistics are still largely incomplete. They are particularly incomplete for the eastern Mediterranean and North Africa Mediterranean coast. Another cause of concern is the lack of provision of *Scomberomorus commerson* (COM, Lacepède 1800) fishery statistics, after its 2021 inclusion into the official small tunas list. No additional fisheries statistics have been reported to ICCAT since 2021 and 0 catches were reported in 2019, 2020 and 2021. The ICCAT Secretariat should continue its efforts to recover these missing data by directly contacting the related CPC's statistical correspondents.

In term of updates and revisions made to T1NC during the meeting, only some minor corrections that included Italian catches between 2006 and 2016, and the inclusion of some Palestinian catch series (**Table 5**). They were adopted by the Group as preliminary estimates for final adoption by the SCRS. As recommended by the SCRS, such estimates should be revised by all CPCs involved.

No documents with fisheries statistics or conventional tagging were presented to the Group.

2.2 Task 2 catch/effort and size data

Task 2 catch and effort (T2CE) and Task 2 size information (T2SZ) availability for all the 13 species between 1993 and 2021, were presented on the SCRS catalogues (**Appendix 5**). Detailed catalogues and datasets for both T2CE and T2SZ were also made available during the meeting. The detailed catalogues with important metadata and characteristics allow CPC scientists to verify dataset characteristics like time stratification (month, trimester, year) and geographical stratification (1x1, 5x5, etc.). The catalogue therefore allows CPC scientists and the ICCAT Secretariat to identify and perform the replacement of the existing datasets with poor resolution. Accordingly, the quality of T2CE and T2SZ information can be improved.

The Group noted that many Task 2 gaps for both T2CE and T2SZ persist across all species. Small tuna scores (scorecard in **Table 4**) indicate the same weaknesses. Efforts should be made to recover those missing datasets. Overall, T2CE information is the most deficient Task 2 for the small tuna dataset.

2.3 Tagging data

The ICCAT Secretariat provided a presentation on the progress on small tunas conventional tagging which included results from the Atlantic Ocean Tropical tuna Tagging Programme (AOTTP). It also focused on tagging-related activities throughout the Atlantic Ocean including tag releases, tag recoveries, time at liberty and movements. It also presented an overview of ongoing activities for maintaining and developing the tagging database. The overall aim of this work was to disseminate the available data. Finally, information was provided about ongoing fieldwork i.e., the collaboration between the ICCAT Secretariat and U.S. tagging correspondents, to work on a full cross-validation of both conventional tagging databases.

The ICCAT Secretariat presented a dashboard on small tuna species to interactively view tagging data. The snapshot in **Figure 4** is for conventional tags. It shows a summary of tag releases and recoveries. The Group acknowledged the ICCAT Secretariat's work on the tagging dashboards and their utility.

The small tuna species conventional tagging summary information is presented in **Table 6** and **Figures 5(A), 5(B)** and **5(C)** (3 maps) following the standard formats normally presented to the SCRS. The same maps by species are presented in **Figure 6** (grid species and three map types: density releases, density recoveries and apparent movement).

2.4 Fisheries indicators (including length data analysis)

SCRS/2023/026 provided a description of fisheries of the narrow-barred Spanish mackerel (*Scomberomorus commerson*) on the Palestinian coast in the South-eastern Mediterranean Sea. The presence of Spanish mackerel has been known since 1935 and its fishery has been commonly carried out since at least 1984. Given the difficulty in collecting effort information, calculating CPUE is very difficult. Recent catches are due to large and medium purse-seines, small purse-seines, gillnets, trawlers, longlines and non-professional fishermen. Peak commercial landings were in 2009, with more than 154 tons; the average between 1995 and 2022 was 56.5 tons, while landings in 2022 reached 69.9 tons.

The Group discussed the paper and asked from which gears the size-composition data reported to ICCAT had come from. The response was that they had come from large and medium purse seiners.

SCRS/2023/027 described Palestinian bullet tuna fisheries in the South-eastern Mediterranean Sea. The spatial population dynamics of *Auxis rochei* in the Gaza Strip area is poorly understood, even if it is a common species for small-scale subsistence fisheries. Landings in recent years have been highly variable. Recent catches of *Auxis rochei* are from large and medium purse-seines, small purse-seines, gillnets, longlines and non-professional fishermen.

The Group noted that very small fish were not being reported. By way of a response, it was suggested that the smaller fish are sold together without any discrete species ID so that getting species specific size composition information was difficult. The Group also asked how effort had varied over the years and if surface longline was used. The answers were that effort was generally constant and that there was shallow longline fishing (and handline fishing) but using very small hook sizes. Finally, the Group asked if there were also sources of length composition information, for example from adjacent countries. The response was that there was very little information coming from other countries in the area, noting that the absence of such information made it difficult to determine stock status.

3. Review of available and new information on biology and other life-history information of small tunas

3.1 Age and growth (including a summary of the ageing workshop)

SCRS/P/2023/062 presented the report of the Workshop on Swordfish, Billfishes and Small Tuna Age Reading developed at IPMA, Olhão, Portugal, in February 2023. The workshop focused on three Species Groups: small tunas (specifically *Euthynnus alletteratus*, *Sarda sarda*, and *Acanthocybium solandri*), swordfish (*Xiphias gladius*), and billfishes (with a specific emphasis on *Tetrapturus albidus*, *Makaira nigricans*, and *Istiophorus albicans*). These Species Groups have ongoing ICCAT SCRS biology research programs aimed at enhancing our understanding of their biology.

The main objectives of the workshop were to foster collaboration and knowledge exchange among ICCAT scientists working on these species, standardize methodologies, review completed work, and outline plans for advancing these research programs. The workshop aimed to enhance expertise and ensure progress in these important areas of study. The work pertaining to small tunas was to:

- Standardize the best methodology to process spines and otoliths for LTA, BON and WAH.
- Review results from calibration exercises and standardize readings among age readers.
- Plan the age validation work.

SCRS/2023/084 presented some biological parameters of the three species of small tunas: little tunny: *Euthynnus alletteratus* (Rafinesque, 1810); Atlantic bonito: *Sarda sarda* (Bloch, 1793) and bullet tuna: *Auxis rochei* (Risso, 1810) caught in the bay of Bou-Ismail (Tipaza) during the autumn of the year 2022. The study is based on a monthly sampling of the last three months of the year fished by small-scale fisheries in the central zone of Algeria. von Bertalanffy's growth parameters were determined by studying size structures: the asymptotic length (L_∞), the growth coefficient (K), and the theoretical age (t_0) at length zero for *Euthynnus alletteratus* and *Sarda sarda*. For the bullet tuna, due to small sample numbers, it was not possible to estimate von Bertalanffy growth parameters.

The analysis of the size structures of *Euthynnus alletteratus* leads to the following mathematical expressions of linear growth of Von Bertalanffy: $LF = 101.54 (1 - e^{-0.24(t+0.5)})$. The growth coefficient (K) is estimated at 0.24. This value is like those found in works on the coasts of Tunisia (Hattour, 1984). The analysis of size structures of *Sarda sarda* leads to the following Von Bertalanffy linear growth mathematical expression: $LF = 66.85 (1 - e^{-0.62(t+0.21)})$. The growth coefficient (K) is estimated at 0.62. This value is almost close to those found on the Spanish coasts (Valeiras *et al.*, 2008) and this is due to the absence of the largest and smallest individuals. For the bullet tuna, due small size samples, it was impossible to estimate von Bertalanffy growth parameters.

The Group discussed the possibility of collecting small and large sizes samples for both species that have appeared in the study area. Similarly, it has been noted that the limited range of sizes found in *Sarda sarda* indicates that the results should be approached with caution, as they may reflect a certain population bias. The author acknowledges that this analysis is preliminary due to the recent initiation of the sampling program and commented that additional information will be gathered and incorporated over time.

SCRS/P/2023/047 described an update on the age and growth of Atlantic bonito (BON) and little tunny (LTA) developed in the February 2023 Workshop on Swordfish, Billfish and Small tunas Age Reading. Methodologies applied in otoliths and spines were explained. A methodology for standardization and improvement in spine analysis for BON and LTA was presented. The results of the spines and otoliths analysis were presented, compared, and discussed.

In addition, training was carried out with sections of BON and LTA spines to perform age estimation. In the same way, a comparison was realized between age structures (otoliths and spines) of the same individual to compare and calibrate readings. The group of experts agreed on the use of spines for the annual ages since the resolution is better in these species. It was suggested to use the daily age in otoliths to estimate the 0+ age growth curve and the decimal age for the rest of annual samples. The Group recommended increasing the processing of otoliths from small individuals to calculate the daily age, since the samples processed so far are low.

The Group highlighted that caution should be exercised when interpreting certain parameters estimates for those areas where the size range is incomplete, for example small sizes of *Sarda sarda* in the Southeastern Atlantic, as the results may not be entirely accurate. Missing size samples were discussed for sampling in the future. However, it is worth noting that this study represents the most comprehensive research conducted to date across the Atlantic, despite the potential limitations in size or sample availability for different areas in both species.

SCRS/P/2023/055 presented an updated length weight relationship of small tuna caught in Tunisian waters. Length-weight relationships (LWR) were estimated for 2 small tuna species which are of economic relevance in the commercial fisheries caught in Tunisian waters. A total of 339 fish caught by purse seine were sampled from 2019 to 2022 as part of ICCAT Small Tunas Year Program (SMTYP). Significant length-weight relationships with high correlation coefficient were found for both species. LWRs indicated isometric growth for *Euthynnus alletteratus* and negative allometric growth for *Sarda sarda*.

With regard to length-weight samples and with the final objective of finishing updates to the calculation of length-weight relationships for these small tuna species, the Group requested that each CPC update their data and, above all, review the data that they have so far provided. Soon each country will receive an analysis of their data and proposals for checking or improving these data. The goal is that by all the results obtained will be presented by the 2023 September Meeting.

3.2 Reproduction and maturity

SCRS/P/2023/043 analyzed samples of little tunny acquired under Short-Terms Contracts from the SMTYP (2018 to 2021). The study presents the results on the reproductive biology of little tunny (LTA) using the stock/species delimitation published in Ollé *et al.*, 2020 (MED_NE ATL and NE_SE ATL). The study used a combined approach (Macro (153)/Micro (403) to the Gonad stage analysis. Results indicate that LTA spawn in both areas and show essential differences in spawning season - the MED_NE ATL stock Spawn from June to August, peaking in July. In contrast, the NE_SE ATL Stock has a protracted spawning season peaking in January and September. These results agree with previous papers in the Mediterranean. The L_{50} (sex combined) of the MED_NE ATL Stock is significantly Larger (50.1 cm SFL) than those of the NE_SE ATL stock (42.74 cm SFL).

The Group noted that the difference in the observed spawning periods between MED_NE ATL and NE_SE ATL may be due to the fact that most of the samples come from the Western Mediterranean and that more samples from the NE_ATL area are needed to fully understand and determine the beginning of the spawning period of LTA. The author confirmed the conclusions of the Group while indicating that the samples of the NE_ATL area come mainly from EU-Portugal.

SCRS/2023/087 analyzed wahoo (WAH) samples from the SMTYP (2018 to 2021). The study showed that WAH have a long spawning season from March to October, peaking in August and September. While it is a single species, spawning occurs in both locations.

The Group suggested that it would be better to analyze the maturity ogives by area, because the results show a split breeding pattern for the wahoo. The author explained that this analysis can be done easily and will be presented at the next meeting. However, the author indicated that the lack of data during March and the total absence of samples in April and May could be the cause of the anomalies observed in the results. The Group recommended that the author include estimates of L95 in the results, given its importance in data-limited stock assessment methods.

3.3 Genetics

Regarding stock structure, the Group prioritized the following activities in 2021 and 2022: i) to refine the stock structure analysis for WAH, BON, and LTA; ii) to complete the stock structure analysis for FRI and BLT; and iii) to investigate genetic species differentiation between FRI and BLT (ICCAT SMTYP, 2020). A summary of stock structure analyses done during the last few years was presented. The information was focused on three main priorities as follows below.

BON

As determined by mitochondrial markers and confirmed by genomic techniques, there is clear genetic differentiation in two areas: i) North Atlantic, and Mediterranean (PRT, ESP, TUN, and MLT) as one; ii) and the Tropical Atlantic (CIV, SEN, MRT, MAR) the other.

LTA

Deep genetic differentiation at the species level has been observed between two areas: i) the North Atlantic and Mediterranean (PRT, ESP, TUN, and MLT) as one; and the eastern central Atlantic (GAB, CIV, and SEN) as the other. This genetic differentiation has been confirmed using multiple unlinked markers, including mitochondrial, nuclear, and genomic markers. Genetic differentiation has also been observed at the population level among CIV, SEN, and GAB areas. Within the Mediterranean region, MLT is slightly genetically differentiated from PRT, ESP, and TUN.

FRI and BLT

Genetic analysis revealed that 20% of purported FRI and BLT specimens were misidentified as belonging incorrectly to one or the other of these two species. No genetic structure was observed in either of the two species. Because of the small genetic sample size in some locations, these last results should be interpreted with caution.

The results of little tunny genetics studies show the possible presence of two (cryptic) species within the area. The Group noted that it is necessary to continue research on other fields such as physical examination, reproductive behavior, growth, etc. This work will require large samples from the waters off Morocco and Mauritania, including the Canary Islands. This aspect will be considered in the SMTYP.

The Group recognized that new information could have an impact on future stock assessments.

3.4 Other

SCRS/P/2023/048 presented a study on the use of otolith shape of *Euthynnus alleteratus* to differentiate between spatial subunits in the Eastern Atlantic. The shape of sagitta otoliths was utilized to compare harvested individuals of little tunny (*Euthynnus alleteratus*) from coastal areas spanning the Eastern Atlantic, including the Mediterranean Sea.

The Group congratulated the study authors and noted that it complements the genetics study conducted on stock structure. To improve bonito stock-structure information, the Group recommended that the range of sampling be extended to other regions.

SCRS/P/2023/053 presented the status of studies the Brazilian research group carried out as part of the PROTUNA project. The first step was reconstructing catch and size frequencies for seven species (BLF, BRS, FRI, KGM, LTA, WAH, and DOL). Three stocks (BRS, KGM and DOL) were then evaluated using length-based and Stock Synthesis methods (catch + size frequencies). Life-history parameters choices were critical for characterizing stock status because the models were highly sensitive to data inputs. The remaining stocks (WAH, LTA, FRI, BLF) should be assessed following a similar method in the next few months. Brazil has committed to develop a monitoring program for at least two species: king mackerel (KGM) and serra Spanish mackerel (BRS).

4. Update of Data Poor Methods and reviews of appropriate approaches for future development of management advice

SCRS/P/2023/053 addressed the assessment of 3 stocks (KGN, BRS and DOL) exploited by the Brazilian fishery using data-limited approaches. The datasets used were reconstructed catch statistics and reconstructed length frequencies. Length-based methods combined with catch methods were used with a range of different population parameters (M, K, L₅₀, L_∞, S₅₀, LB-SPR and SS-DL-tool). *Scomberomorus brasiliensis* (KGM) showed for all alternative scenarios a very depleted stock (B/B₀<20%) in recent years while *Scomberomorus cavalla* (BRS) showed a moderately overfished status (B/B₀<40%). For its part, *Coryphaena hippurus* (DOL) results varied, for both northern and southern stocks, according to the depletion input in the model - strong depletion led to overfished status.

SCRS/P/2023/069 provided an overview of the workshop on data-limited methods that was held at ICCAT in May 2023. The structure of the course was described.

The Group then discussed that this capacity building is important for the local scientists to understand the need to gather better information. The ICCAT Secretariat indicated that the scorecard system should be used to understand and determine a priority species list. The Group agreed that such an initiative should be continued. The Group suggested organizing a second training session focusing on the stock assessment of the main stock using the SS-DL tool.

5. SMTYP: achievements and programed activities for 2023

The Group reviewed the SMTYP's achievements and programed activities for 2023. This included the background and objectives for the target species. Then, it reviewed the program's organization, its sampling achievements by areas, and the participants involved. For species and area, the review identified the main gaps in size sampling that need to be filled. Finally, the Group reviewed the available biological samples for age and growth, reproduction, and genetics.

The Group noted that CPCs can continue to sample. But it reiterated that any invoice must be issued during the period of the signed contract.

The Group discussed the problems with shipping scientific samples and some potential solutions. The Group noted that it was becoming increasingly difficult to ship samples because of customs limitations citing the Nagoya protocol, and because samples preserved in ethanol are flammable and therefore problematic for shipping. The Group noted that the Nagoya Protocol establishes measures to avoid genetic piracy and should not impede shipping scientific samples as it does not apply to ICCAT's migratory species. About solving the problems posed by storing samples in ethanol, one proposed solution was to ensure that had been soaked in the alcohol for at least 24 hours before draining them just prior to shipping.

The Group also discussed the need to keep otoliths when collecting tissues (muscle or gonads). The Group was encouraged to continue collecting and storing them. It noted that once such structures are available, they can be used for multiple purposes; in addition to ageing, such purposes include otolith shape analysis, and microchemistry. The Group discussed who would process hard structures (otoliths and spines). Brazil's Federal University of the Semi-Arid Region team assumed responsibility for this.

6. Recommendations on research and statistics

General recommendations

The Group recommended that Statistical Correspondents and/or National scientists revise, update, complete, and submit their small tuna T1NC series to the ICCAT Secretariat. This revision should consider **Appendix 5** (SCRS catalogues), the split of "unclassified" gear catches to specific gear codes, and the completeness of Task 1 gaps identified. The Statistical Correspondent and/or National scientists of CPCs should correct inconsistencies identified in T2SZ series. For the 13 species of small tuna, the T2SZ revision should have as reference, the stratification of the samples by gear, month, $1^\circ \times 1^\circ$ or $5^\circ \times 5^\circ$ squares, and SFL size classes of 1 cm (lower limit). CPCs should further improve their estimates of total catches, as there are still important gaps in the basic data available. These data are required as inputs for most data-limited stock assessment methods. The ICCAT Secretariat should continue its work on the data recovery and making inventories of tagging data for small tuna species. This process will require active participation of the national scientists who hold such data.

The Workshop on Data-limited Assessment Methods for Small Tunas highlighted the minimum need for data from CPCs to allow for estimating stock status. The Group recommended always estimating the L_{95} (Length at Full Maturity) parameter in studies on maturity for all species, because it is essential for the stock assessment of data-limited species, such as the small tunas.

The Group recognizes that the Nagoya Protocol is not applicable to migratory fish species such as those under the management and mandate of ICCAT. ICCAT should be considered within the provision of Article 4, point 1 of the Protocol since it is based on a previously existing international agreement. Furthermore, all migratory fish species managed by ICCAT do not belong to any individual state (sovereign rights, as described in Article 6, point 1 of the Protocol) and therefore the Nagoya Protocol shall not be applied to ICCAT species (contained in *Recommendation by ICCAT on fishes considered to be tuna and tuna-like species or oceanic, pelagic, and highly migratory elasmobranchs [Rec. 19-01]*). Accordingly, CPCs that are experiencing some difficulties to ship samples within the SMTYP should clarify the non-applicability of the Nagoya Protocol with the relevant national authorities.

The Group recommended that CPCs from the northwest Atlantic area join SMTYP so that they provide samples for the current studied species (BON, LTA and WAH have landings in NW).

Recommendations with financial implications

The Group recommends completing the second part of the workshop for applying data-limited methods for small tuna stock assessment. Data-limited models include integrated, length, and catch based models. With such tools it is possible to estimate population status and depending on the method used, it is also possible to estimate fishery reference points. Such approaches require data and expert input from biologists and fisheries experts. As such, the Group recommended that the second part of the in-person workshop be held to advance research and application of data-limited methods to some small tuna species. Costs are estimated at €30,000, which would allow for the participation of 2 experts and the same National scientists who attended the first workshop.

The Group recommends doing a morphometric and morphological comparison between fresh/frozen specimens of *Euthynnus spp.* from the NETAM and the Eastern Tropical Atlantic to assess if physical characters can be used to discriminate the two genetically different species.

The Group recommends doing a workshop on the validation of the maturity scales.

7. Other matters

Juan-Jordá *et al.*, 2023 presented a summary of the main objectives and outcomes of a three-day online workshop entitled “Identification of regions in the ICCAT Convention area for supporting the implementation of ecosystem-based fisheries management” held in March 2022. This workshop established a framework and an iterative and adaptive process to delineate ecoregions in ICCAT. Regionalization of the ICCAT Convention area into areas that are ecologically meaningful, yet large enough to be practical, could provide a foundation for developing a wide range of integrated scientific and advice products. This workshop resulted in a proposal for eight candidate ecoregions within the ICCAT Convention area. The SCRS is currently being consulted on this ecoregion proposal to increase awareness of this planning, to increase awareness of this advice tool to guide Ecosystem Approach Fisheries Management (EAFM) implementation, and to receive further feedback to refine the ecoregion delineation process. In addition, the Subcommittee on Ecosystems and Bycatch is working to develop pilot studies of ecosystem-based advice products (e.g., Ecosystem and Fisheries Overviews) using ecoregions case study to show their applicability to the Commission.

The Group welcomed the presentation and thanked the presenter.

The Group noted that the distribution of some small tuna species overlap with multiple ecoregions. It further noted how the area off Mauritania, which is within the Tropical Atlantic Ecoregion, is known to be a geographic barrier delimiting temperate and tropical populations of small tunas (for example *Sarda sarda*). The Group asked about the implications of such features for setting ecoregions. It was explained that the ecoregions and their boundaries are not expected to fit the distributions of all tuna and tuna-like species managed in ICCAT. Instead, ecoregions aim to be a tool to support regional ecosystem planning and research. At this point in the development of ecoregions, it is important to check that the proposed ecoregions each exhibit relatively homogenous ecosystems within their boundaries in terms of oceanography, ICCAT fisheries/fleets, and species. This will justify the number of ecoregions and their boundaries, or it will determine if further refinements are needed. It was explained that it is an ongoing and iterative process and that probably several workshops will be needed to refine the proposed ecoregions. Moreover, it was mentioned that the pilot studies underway aim to characterize the main composition of fisheries, fleets, and species being targeted within each ecoregion to evaluate their similarity/dissimilarity. This will guide future iterations for adjusting the current number and boundaries of the current ecoregions.

The Group reflected on several considerations for interpreting and using ecoregions to support analysis and research. It was noted how the sampling areas/statistical areas in ICCAT currently used for the submission of fisheries statistics (for example Task 1 data) do not correspond with the ecoregion spatial boundaries. This will create difficulties when compiling and analyzing ICCAT fishery statistics by ecoregions. ICCAT georeferenced catch and effort statistics like Task 2 catch and effort data could be used to support spatial analysis of fisheries data that are highly incomplete for many species including small tunas. The Group discussed some of the current limitations of the CATDIS dataset which are that they are at spatial resolution of 5x5 degrees and are especially problematic for historical data. The ICCAT Secretariat explained how there are plans to further process the CATDIS dataset to: 1. improve the spatial resolution from 5 to 1 degrees and temporal resolution from quarters to months, and 2. add other species (some shark species and southern bluefin tuna). This will require that CPCs revise their historical data and increase the spatial resolution of the data they currently submit. Due to a lack of spatial catch and effort information, there is no CATDIS dataset for sharks or small tunas. Accordingly, catch series for these species cannot not be assigned to ecoregions. The Group discussed the difficulties of including small tunas in the CATDIS dataset and emphasized the importance of recovering and improving fishery statistics with high temporal and spatial resolution across the full extent of their distribution.

8. Adoption of the report and closure

The report was adopted, and the meeting was closed. The summary for the SCRS Plenary meeting will be circulated by the Chair for adoption.

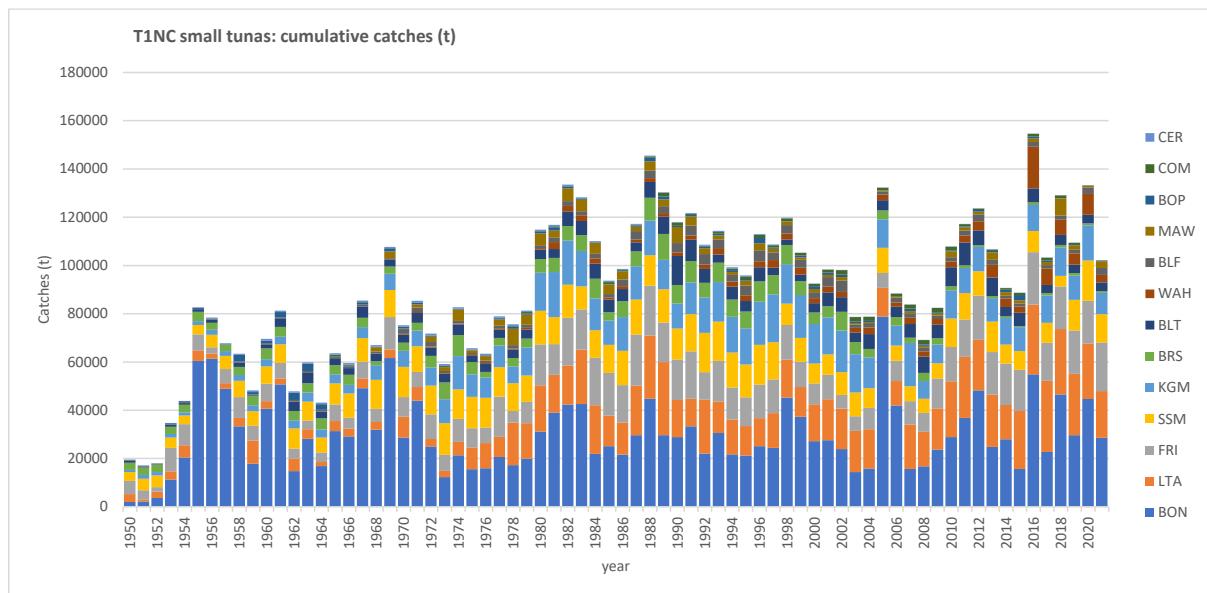

Figure 1. Cumulative small tuna catches (t) in Task 1 (T1NC) by species and year.

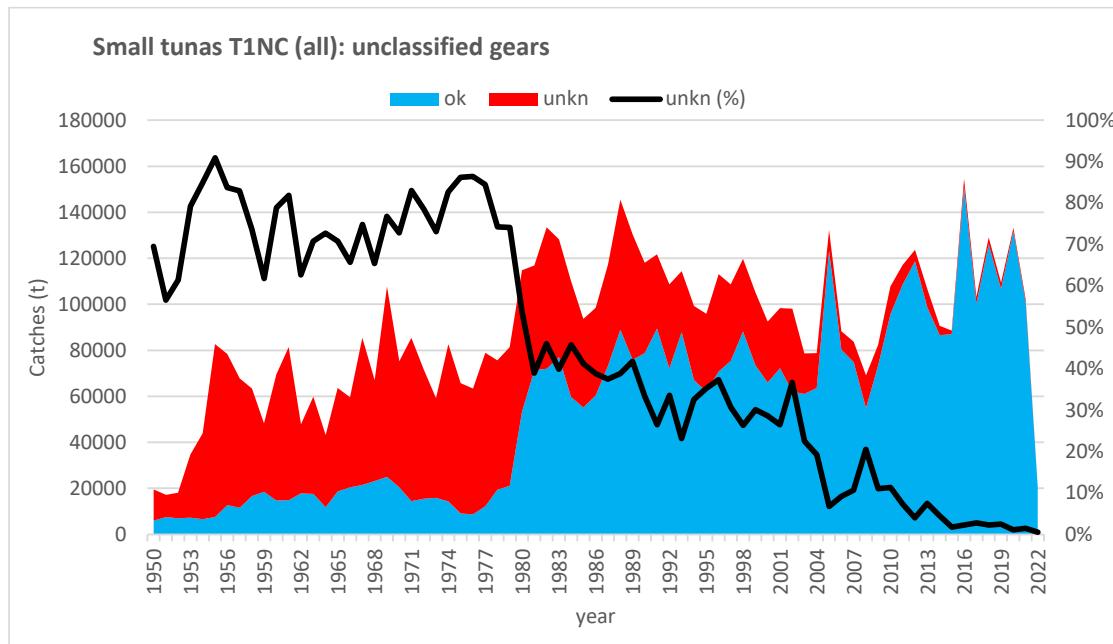

Figure 2. Total small tuna catches (t) with and without gear (UN: unclassified/unknown) by year. The ratio (%) of unclassified gears is shown in the right axis (black line series).

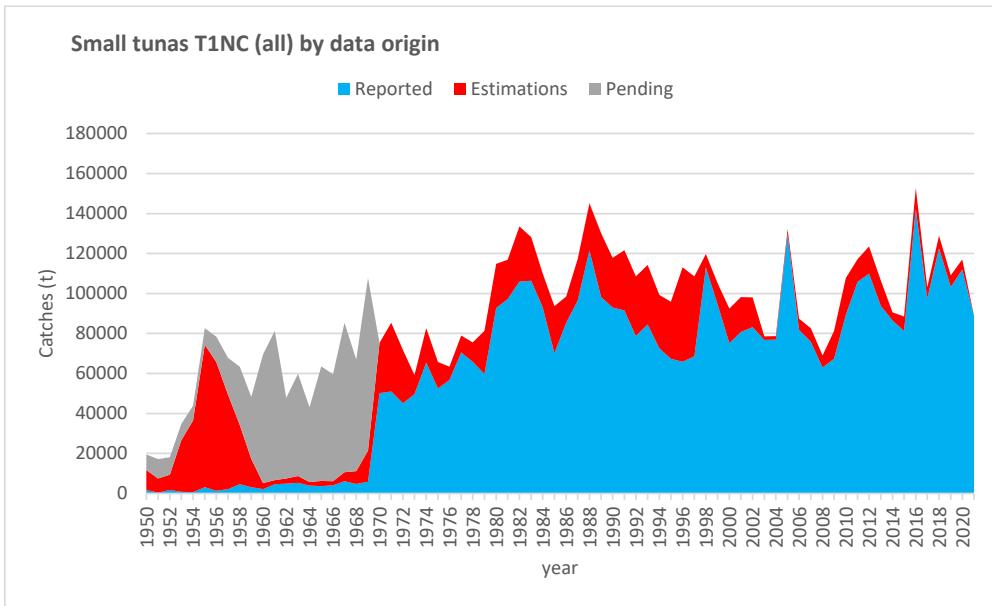

Figure 3. Total small tuna catches (t) in Task 1 (T1NC) by data origin and year. The data origin was classified in three main categories: reported by CPCs, SCRS estimations (including carry overs), and pending identification (ongoing work on identifying the data sources).

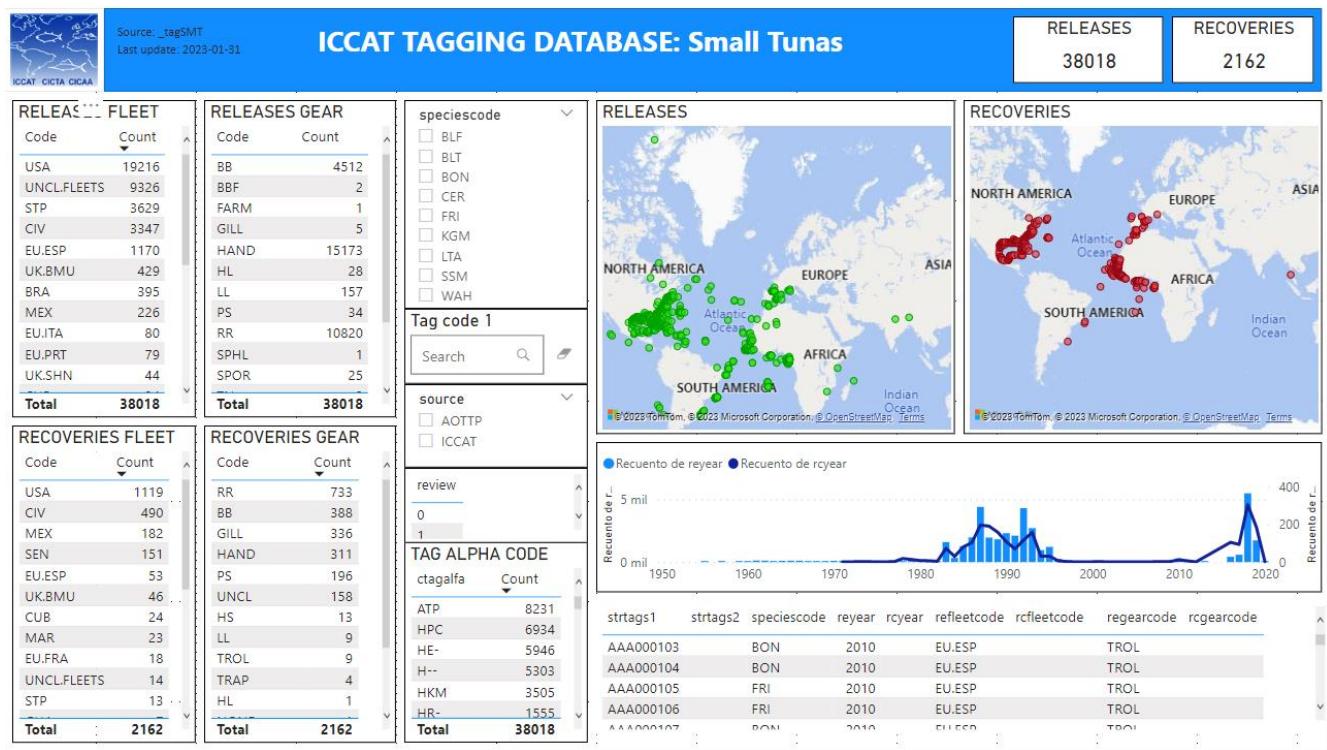

Figure 4. Screenshot of the conventional tagging dashboard.

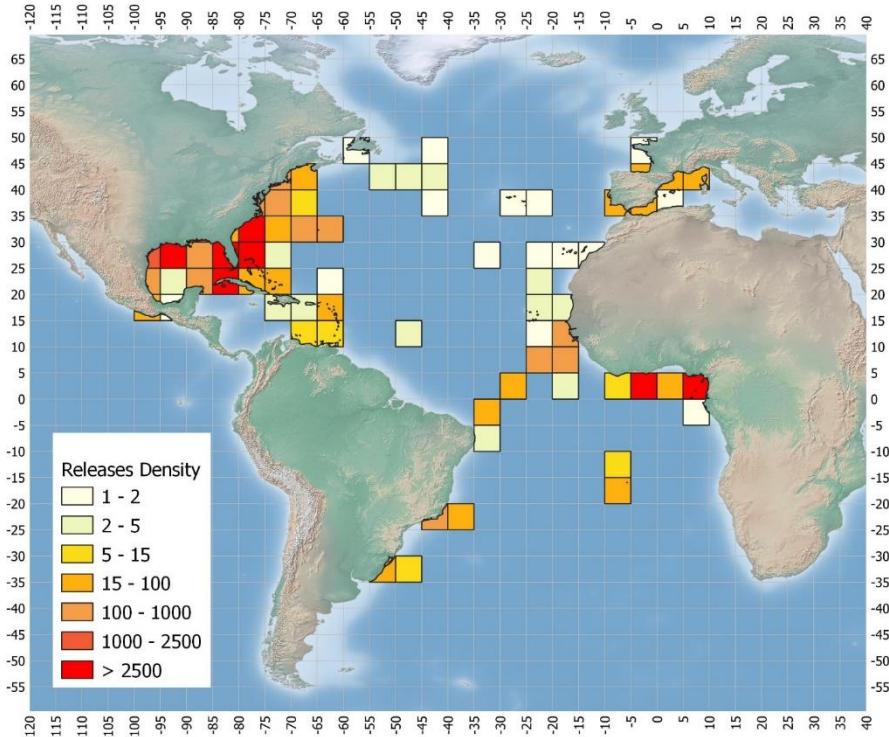

Figure 5 (A). Density of the release positions at 5x5 lat lon grids (A) in ICCAT conventional tagging on small tunas (including ICCAT AOTTP).

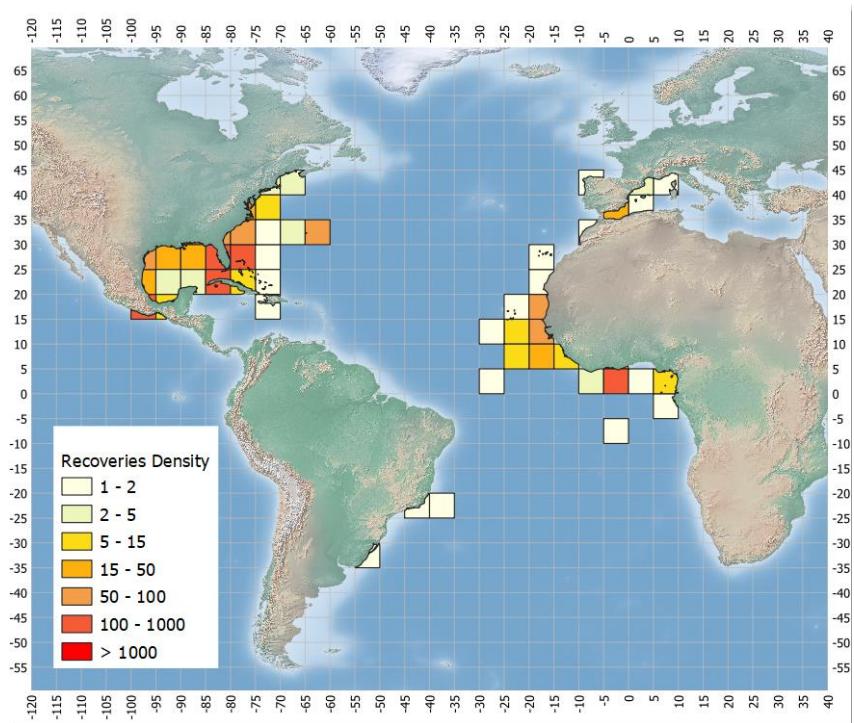

Figure 5 (B). Density of the recovery positions at 5x5 lat lon grids in ICCAT conventional tagging on small tunas (including ICCAT AOTTP).

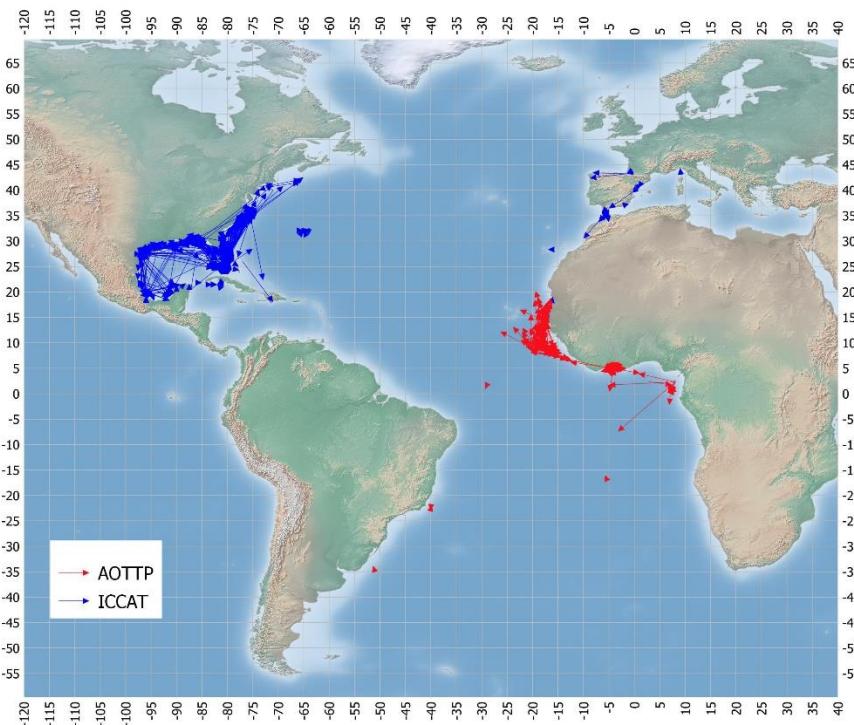

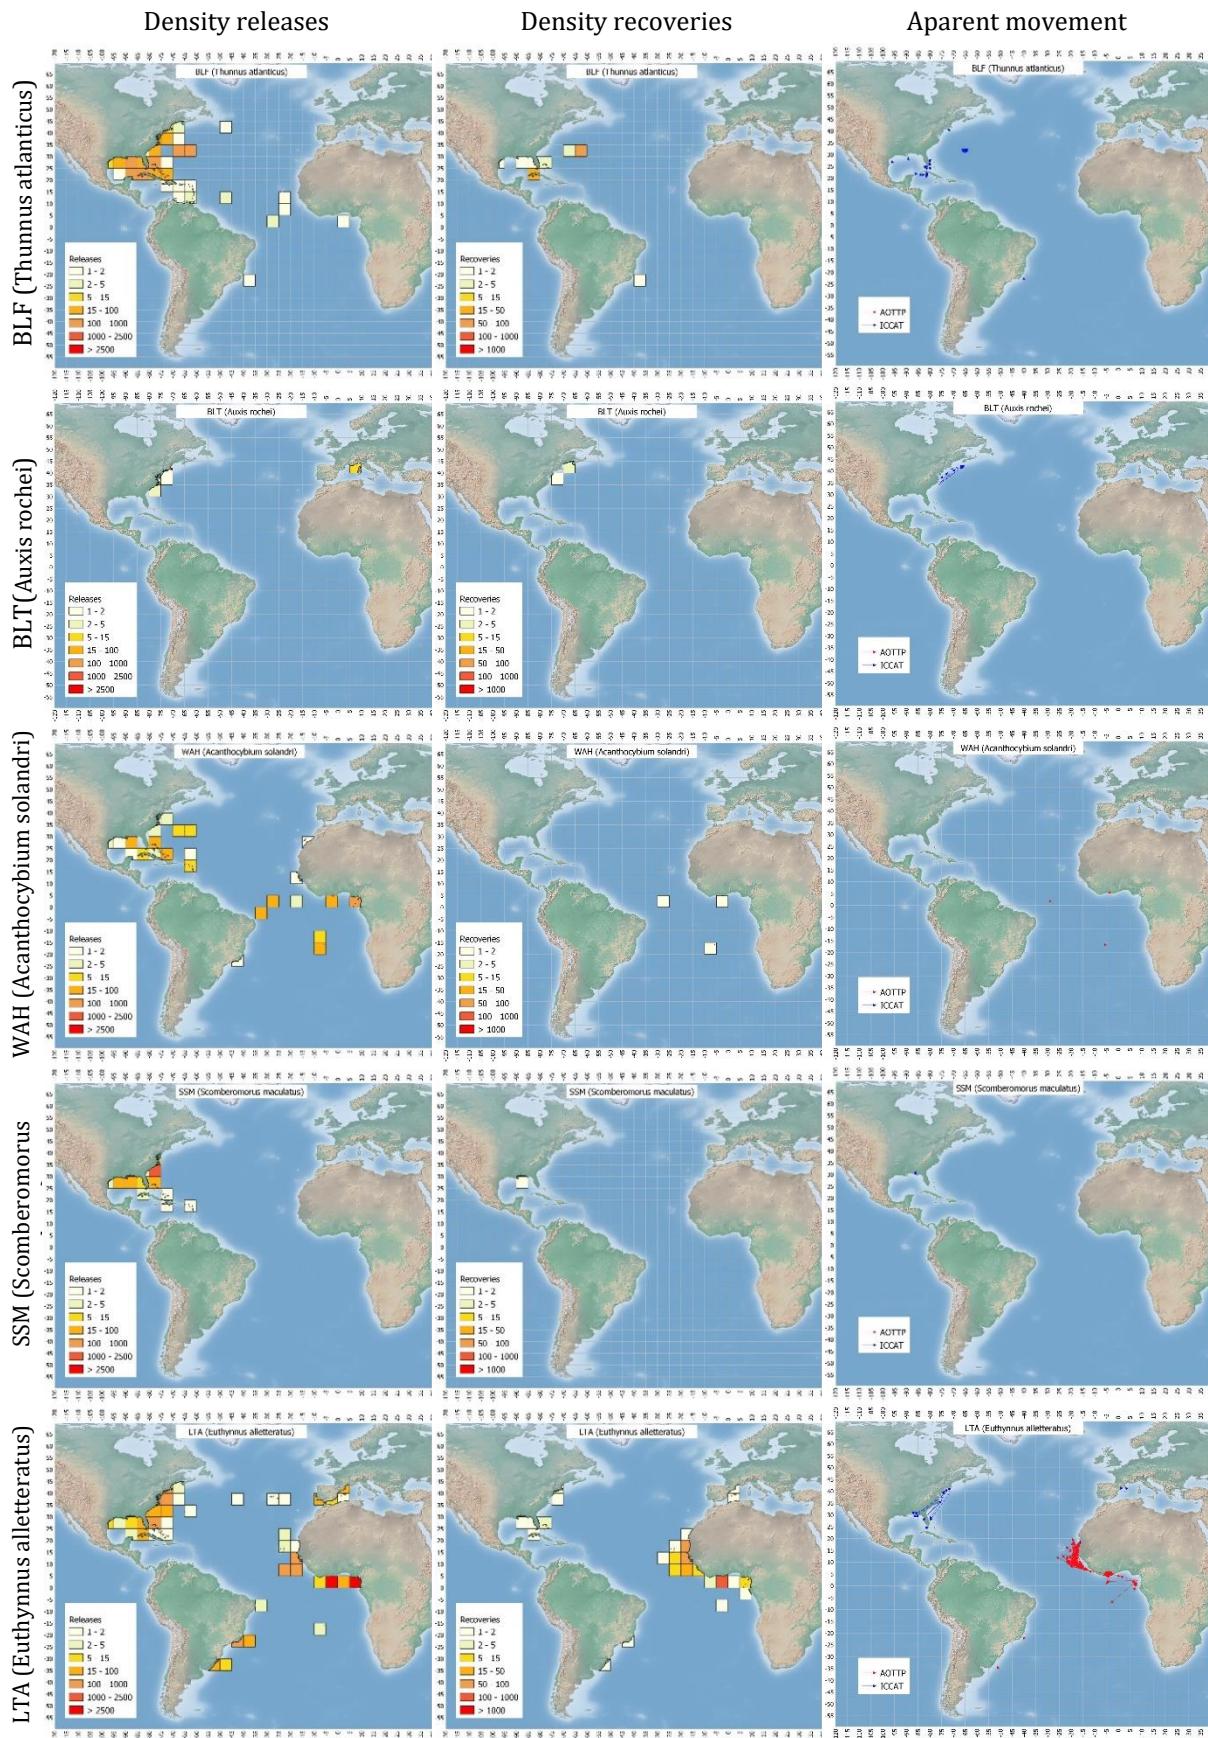

Figure 5 (C). Straight displacement from the release to the recovery position of the recaptured specimens in ICCAT conventional tagging on small tunas (including ICCAT AOTTP).

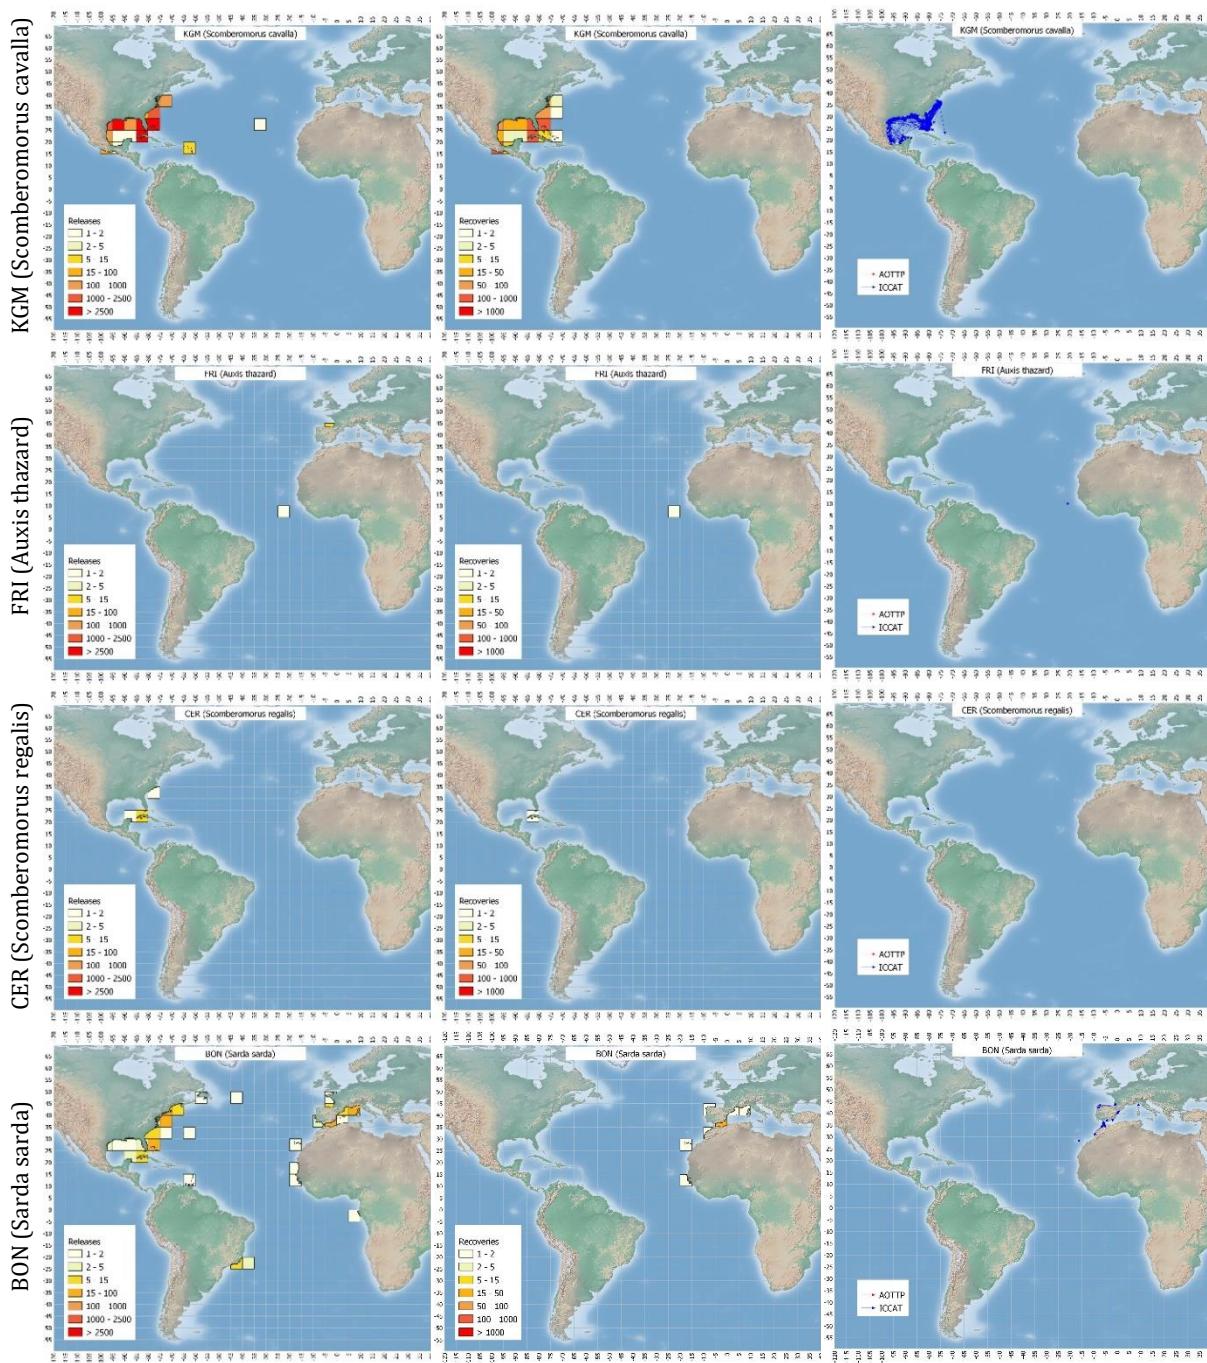

Figure 6. Maps which show the density of the release positions at 5x5 lat lon grids, density of the recovery positions at 5x5 degree strata, and a map with the straight displacement from the release to the recovery position of the recaptured specimens, respectively for each species of the group of small tunas.

Appendix 1

Intersessional Meeting of Small Tunas Species Group
(Madrid, Spain/Hybrid – 15-18 May 2023)

Objectives

The workplan for the Small Tunas Species Group for 2023 included a four-day intersessional meeting. The objectives of the meeting are: organize all the data and information that have been obtained to date; to organize the size and catch composition information; to present new life-history information; and, to review data-limited assessments that might be applied to small tunas.

Tentative Agenda

1. Opening, adoption of Agenda and meeting arrangements
2. Review of fisheries statistics
 - 2.1 Task 1 (catches) data and spatial distribution of catches
 - 2.2 Task 2 catch/effort and size data
 - 2.3 Tagging data
 - 2.4 Fisheries indicators (including length data analysis)
3. Review of available and new information on biology and other life-history information of small tunas
 - 3.1 Age and growth (including a summary of the ageing workshop)
 - 3.2 Reproduction and maturity
 - 3.3 Genetics (species and stock differentiations)
 - 3.4 Other
4. Update of Data Poor Methods and reviews of appropriate approaches for future development of management advice
5. Small Tunas Year Programme (SMTYP): achievements and programmed activities for 2023
6. Recommendations on research and statistics
7. Other matters
8. Adoption of the report and closure

Appendix 2

List of Participants* ¹

CONTRACTING PARTIES

ALGERIA

Ouchelli, Amar*

Sous-directeur de la Grande Pêche et de la Pêche Spécialisée, Ministère de la pêche et des productions halieutiques, Route des quatre canons, 16000 Alger

Tel: +213 550 386 938, Fax: +213 234 95597, E-Mail: amarouchelli.dz@gmail.com; amar.ouchelli@mpeche.gov.dz

Benounnas, Kamel

Chercheur, Centre National pour le développement de la Pêche et de l'Aquaculture - CNRDPA, 11 boulevard colonel Amiroche, 42000 Tipaza Bou-Ismail

Tel: +213 243 26410, Fax: +213 243 26412, E-Mail: kamel_benounnas@yahoo.fr

Tamourt, Amira¹

Ministère de la Pêche & des Ressources Halieutiques, 16100 Alger

BRAZIL

Frédou, Thierry

Professor Associado, Universidade Federal Rural de Pernambuco - UFRPE, Departamento de Pesca e Aquicultura - DEPAq, Rua Dom Manuel Medeiros s/n - Dois Irmãos, CEP 52171-900 Recife/Pernambuco PE

Tel: +55 81 996 411 154, E-Mail: thierry.fredou@ufrpe.br

Silva Batista, Guelson

Professor, UFERSA, Av. Francisco Mota, 572 - Bairro Costa e Silva, 59.625-900 Mossoró, Rio Grande do Norte

Tel: +55 859 850 32723, E-Mail: guelson@ufersa.edu.br; guelsonsilva@hotmail.com

CÔTE D'IVOIRE

Diaha, N'Guessan Constance

Chercheur Hydrobiologiste, Laboratoire de biologie des poissons du Département des Ressources Aquatiques Vivantes (DRAV) du Centre de Recherches Océanologiques (CRO), 29, Rue des Pêcheurs - B.P. V-18, Abidjan 01

Tel: +225 21 35 50 14; +225 21 35 58 80, E-Mail: diahaconstance@yahoo.fr; diahaconstance70@gmail.com; constance.diaha@cro-ci.org

Neneby, Galla Jean Thierry

Ingénieur Halieute, Chargé d'Etudes à la Direction des Pêches

Tel: +225 077 884 7357, E-Mail: maître_thierry@yahoo.fr

EUROPEAN UNION

Attard, Nolan

Department of Fisheries and Aquaculture Ministry for Agriculture, Fisheries and Animal Rights Agriculture Research & Innovation Hub, Ingiered Road, 3303 Marsa, Malta

Appendix 4**SCRS Documents and Presentation Abstracts as provided by the authors**

SCRS/2023/026 reported the very first data available on the narrow-barred Spanish mackerel (*Scomberomorus commerson*) in the Palestinian area, where this species is present since 1935. The document presented a general overview of the fishing area and the fleets concerned, pointing out thigh concentration of vessels in a very small fishing area. The species is fished mostly by trawlers, but catches are reported also by purse-seiners, gillnets and longlines. The landings for this species are available since 1995, showing peaks in 2009 (159.5 t) and 2021, with a general average of about 59 tons per year. Catch size is ranging from 20 to 120 cm, with a peak of young-of-the-year, showing the presence of a spawning area in front of the Gaza Strip. The data are particularly important, because this Lessepsian species is a top-predator and should be better followed for understanding its ecological aspects. Information about the biology of this species in that area is not available.

SCRS/2023/027 reported the very first data available on the bullet tuna (*Auxis rochei*) in the Palestinian area, where this species is commonly present but where previous data are not available. The document presented a general overview of the fishing area and the fleets concerned. The species is fished mostly by purse-seiners, but also by many other gear types and it is a common target for the small-scale fishery for subsistence purposes. Due to the difficulties for disentangling the catches of bullet tuna from those of other small tuna species which are often reported together, the landings for this species are available only since 2018, showing a negative peak in 2021, with a general average of about 72.8 tons per year. Catch size is available only from the purse-seiners in 2022, ranging from 23 to 42 cm; it is important to note that young-of-the-year are clearly present, showing the presence of a spawning area in front of the Gaza Strip. Information about the biology of this species in that area is not available.

SCRS/2023/084 Ce travail a fourni des informations sur quelques paramètres de croissance de la thonine commune (*Euthynnus alletteratus*), de la bonite à dos rayé (*Sarda sarda*) et du bounitou (*Auxis rochei*) captures dans la baie de Bou-Ismaïl (Tipaza) en période d'automne de l'année 2022. L'étude est fondée sur un échantillonnage mensuel des trois derniers mois de l'année péchées par les petits métiers de la zone centre d'Algérie. Selon les données présentes, les relations calculées mettent en évidence, une allométrie minorante entre la longueur à la fourche et le poids pour *Euthynnus alletteratus* et *Sarda sarda*. Cela exprime que la longueur à la fourche (LF) croît moins vite que le poids total (Wt). Les paramètres de croissance de Von Bertalanffy, ont été déterminés par l'étude des structures de taille : La longueur asymptotique (L_{∞}) et le coefficient de croissance (K) et l'âge théorique (t_0) des individus lorsque leur taille est nulle chez *Euthynnus alletteratus* et *Sarda sarda*.

SCRS/2023/087 - This study analyses samples of wahoo acquired under three Short-Terms Contracts from the ICCAT Small Tuna Year Program (SMTYP 2018 to 2021). The study presents the results on the reproductive biology of Wahoo (WAH) from East Atlantic (AT-NE/BIL94B and AT-SE/BIL97). Our results indicate that the WAH spawn in both areas and have a Protracted spawning season (from March to October), peaking in August-September. These results agree with those offshore of Florida's coast and the northern Bahamas. The L₅₀ for Females was estimated at 94.78 cm SFL. Our results on L₅₀ agree with those in Oxenford *et al.*, 2003 and are slightly lower than other studies on the western Atlantic Ocean.

SCRS/P/2023/043 - This study analyses samples of Little Tunny acquired under Short-Terms Contracts from the ICCAT Small Tuna Year Program (SMTYP 2018 to 2021). The study presents the results on the reproductive biology of Little Tunny (LTA) using the stock/species delimitation published in Ollé *et al.*, 2020 (MEDI_NE ATL and NE_SE ATL). The study used a combined approach (Macro (153)/Micro (403) to the Gonad stage analysis. Results indicate that the WAH spawn in both areas and show essential differences in spawning season—the MEDI_NE ATL stock Spawn from June to August, peaking in July. In contrast, the NE_SE ATL Stock has a protracted spawning season peaking in January and September. These results agree with previous papers in the Mediterranean. The L₅₀ (sex combined) of the MEDI_NE ATL Stock is significantly Larger (50.1 cm SFL) than those of the NE_SE ATL stock (42.74 cm SFL).

SCRS/P/2023/047 - This presentation described an update in age and growth of Atlantic bonito (BON) and little tunny (LTA) developed in the last Workshop of age and growth in February 2023. Methodologies applied in otoliths and spines were explained. A methodology for standardization and improvement in spine analysis for BON and LTA was presented. The results of the spines and otoliths analysis were presented, compared and discussed. In addition, training was carried out with cuts of BON and LTA spines to perform age readings. There was a consensus on the spine readings among experts. In the same way, a comparison was realized between age structures (otoliths and spines) of the same individual to compare and calibrate readings.

SCRS/P/2023/048 - This presentation described the use of otolith shape of *Euthynnus alleteratus* for spatial units differentiation in the Eastern Atlantic. The shape of sagitta otoliths was utilized to compare harvested individuals of the little tunny (*Euthynnus alleteratus*) from coastal areas spanning the Eastern Atlantic, including the Mediterranean Sea. Preliminary analyses were carried out comparing otolith shapes collected in coastal waters of different countries, including Malta, Portugal, Spain, Senegal, Côte d'Ivoire, and Gabon. Significant differences between two groups were identified. The first group comprised samples from the coastal areas in the Northeast Temperate Atlantic and Mediterranean Sea (NETAM Area), while the second group encompassed coastal areas off the Eastern Tropical Atlantic coast of Africa (ETA Area). Notably, the degree of divergence along the rostrum, postrostrum, and excisura of the generated otolith outlines was even more pronounced between these two groups. Remarkably, this study stands as the pioneering work employing otolith shape analysis to differentiate tunas originating from separate spatial units. The implications of these findings extend to the re-classification of previously collected samples and the necessary correction of data time series.

SCRS/P/2023/069 - A training course Data Limited Assessment Methods for Small Tunas was held at ICCAT headquarters on 9-12 May 2023. This course provided a broad overview of the fundamentals and assumptions of data-limited stock assessment methods that can be applied to small tunas. The second part considered the practical application of catch-based and length-based stock assessment methods within the data-limited stock assessment framework. Three applications were highlighted (1) a risk analysis: Productivity-Susceptibility Analysis (PSA), (2) a length-based model: LB-SPR and (3) a catch and length approach: Stock Synthesis SS-DL.

Appendix 5**SCRS Tables for Small Tunas**

Table 1. [a-q] Small tuna species standard SCRS catalogues on statistics (Task 1 and Task 2) of the major ICCAT small tuna species by stock/area, major fishery (flag/gear combinations ranked by order of importance) and year (1993 to 2022). Only the most important fisheries (representing about 95 % of Task 1 total catch) are shown. For each data series, Task 1 (DSet= 't1', in tonnes) is visualised against its equivalent Task 2 availability (DSet= 't2') scheme. The Task 2 colour scheme, has a concatenation of characters ('a'= T2CE exists; 'b'= T2SZ exists; 'c'= CAS exists) that represents the Task 2 data availability in the ICCAT-DB. See the legend for the colour scheme pattern definitions. An overall score for the last 30 years (1 score per catalogue) is also shown in all catalogues. Shaded blue cells (DSet= "t1" only) could indicate missing catches.
