

CHAPTER 2.1.10.1: ATLANTIC BONITO	AUTHORS: B. MOURATO, T. BARRETO AND F. LUCENA-FRÉDOU	LAST UPDATE: June 2021 Original: English
--	---	---

2.1.10.1 Description of Atlantic bonito (BON)

1. Names

1.a. Classification and Taxonomy

Species name: *Sarda sarda* (Bloch, 1793)

ICCAT species code: BON

ICCAT names: Atlantic bonito (English), Bonito (Spanish), Bonite à dos rayé (French).

According to Collette and Nauen (1983), Atlantic bonito is classified as follows:

- Phylum: Chordata
- Subphylum: Vertebrata
- Superclass: Gnathostomata
- Class: Osteichthyes
- Subclass: Actinopterygii
- Order: Perciformes
- Suborder: Scombroidei
- Family: Scombridae
- Genus: Sarda
- Species: *Sarda sarda*

1.b. Common names

List of vernacular names used by different countries according to ICCAT, FAO and Fishbase (www.fishbase.org). The list of countries is not exhaustive and some local names might not be included.

Albania: Palamiti.

Algeria: Bonite, Bonite à dos rayé, Palamita, Rselia.

Angola: Bonito, Sarda, Sarrajão, Serrajão, Serralhão.

Argentina: Bonito.

Azores Islands: Atlantic bonito, Bonito, Serra.

Benin: Kpokoukpokou.

Brazil: Bonito, Bonito-atlântico, Cavala, Sarda, Sarrajão, Serra, Serra-comum, Serra-de-escama, Serra-sarda.

Bulgaria: Lakerda, Palamud, Turuk.

Cabo Verde: Bonito, Bonito do Atlântico, Bonito-de-lombo-listado, Sarrajão.

China Main: 狐鰹.

Colombia: Bonito.

Croatia: Palamida, Polanda.

Cuba: Bonito.

Denmark: Pelamide, Rygstribet pelamide.

Finland: Sarda.

Former USSR: Atlanticheskaya palamida, Lacherda, Pelamida.

France: Bonite à dos rayé, Bonicou, Boniton, Boussicon, Boussicou, Conite, Pélamide, Pelamide commun, Pelamido.

Germany: Bonito, Pelamide, Unechter Bonito.

Greece: Ρίκι, Τουλίπι, Τορνέττα, Παλαμίδα, Ντορίκι, Κοινή, Palamida, Palamida, Ternata, Toriki, Touliki.

Guinea: Koko.

Iceland: Rákungur.

Israel: Sarda.

Italy: Bonnicou, Cavaritu imperiale, Paamia, Paamie, Palameit, Palametiedde, Palametto, Palamia, Palamida, Palamide, Palamidu, Palamita, Palamito, Palamitu, Palamitu maiaticus, Palammete, Palammete cuvarita, Paramira, Parantuni, Pelamida, Pilamitu, Pirantuni, Pisantuni, Sangulu, Scurma, Sgamiru, Sgonfietto, Strombo, Tombarello, Tunnacchii, Tunnareiu.

Japan: Hagatsuo, Kigsunegegatsu.

Lebanon: Ghazâl.

Libya: مخطط, Balamit, Blamto, Mgħatat.

Madeira Island: Cerda, Serrajão, Serralhão.

Malta: Palamia, Palamit, Palamita, Plamitu, Plamtu.

Marshall Islands: Loj, Looj.

Martinique: Bonite.

Mauritania: Bonite, Bonite à dos rayé, Bonito, Doulou doulou, Pélamide.

Mexico: Bonito del Atlántico.

Monaco: Palamida, Paramida, Piramida.

Morocco: Bonito, Cerda.

Namibia: Atlantiese bonito, Bonito, Pelamide.

Netherlands: Atlantische boniter, Bonito.

Norway: Pelamide, Stripet pelamide.

Poland: Pelamida.

Portugal: Bonito, Bonito-do-Atlântico, Sarrajão, Serra.

Romania: Lacherda, Palamida, Pelamida.

Russian Fed: пеламида атлантическая.

Senegal: Bonite à dos rayé, Dullu dullu, Kiri kiri, wal.

Sierra Leone: Bonito.

Slovenia: Palamida.

South Africa: Atlantic bonito, Atlantiese bonito, Katonkel.

Spain: Bonito, Bonito atlántico, Bonito del Atlántico, Bonitol, Bonítol, Bonitu, Cerda, Sierra.

Sweden: Pelamida, Pelamide, Ryggstrimmig pelamid.

Syria: Palamet.

Trinidad Tobago: Bonito.

Tunisia: Balamit, Palamid, Rsela, Toumbrel.

Türkiye: Altıparmak, Çingenepalamudu, Kestanapalamudu, Palamut, Palamut torik, Palamutvonozu, Piçuta, Sivri, Torik, Zindandelen.

UK: Atlantic bonito, Belted bonito, Bonito, Pelamid, Short finned tunny, Stripe-backed pelamis.

Ukraine: Pelamida.

Uruguay: Bonito.

USA: Atlantic bonito, Bloater, Bone jack, Bonito, Boston mackerel, Common bonito, Skipjack.

Venezuela: Cabaña blanca, Cabaña cariba, Cabaña de dientes.

2. Identification

Figure 1. Drawing of an adult *Sarda sarda* (by A. López, ‘Tokio’).

Characteristics of *Sarda sarda* (see Figure 1 and Figure 2)

Atlantic bonito is a small tuna species. In the Atlantic Ocean, maximum length was reported at 91.4 cm fork length and maximum weight at 5.4 kg. In the Black Sea, maximum length is 85 cm fork length and 5 kg weight (Collette and Nauen, 1983).

Colour:

- Back and upper sides steel blue, silvery below.
- 5-11 longitudinal oblique dorsal dark stripes running forward and downward (with a greater angle than in other species of *Sarda*).
- Dorsal and caudal dusky. Pectoral pale. Other fins more or less silvery.

External:

- Body elongate and slightly compressed.
- Body completely covered with very small scales except on the well-developed corselet.
- Caudal peduncle slender, with a well-developed lateral keel between two smaller keels on each side.
- First dorsal fin long, nearly reaches second dorsal.
- First dorsal fin: 20-23 spines.
- Dorsal finlets: usually 8.
- Anal fin: 14-17 rays.
- Anal finlets usually 7.
- Pectoral fin rays: 23-26, usually 24-25.
- Gill rakers on first arch: 16-23.
- The mouth is moderately large.
- 16-26 conical teeth in upper jaw, 12 to 24 in lower. No teeth on tongue.
- Lamellae of olfactory rosette 22-33.
- Intrapelvic process small and bifid.
- Length of fin base 29.1 to 33% of fork length.

Internal:

- Swim bladder absent.
- Spleen large and prominent in ventral view.
- Liver with elongate left and right lobe and short middle lobe.
- No cutaneous artery.
- Vertebrae: 50-55.

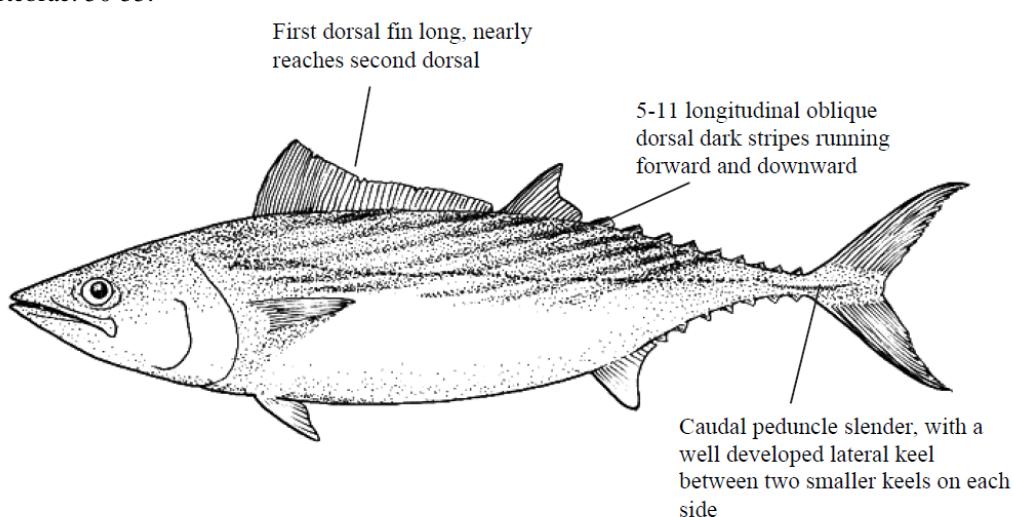

Figure 2. Synthesis of the most outstanding characteristics of *Sarda sarda* (by A. López, 'Tokio').

3. Distribution and population ecology

3.a. Geographical distribution

Atlantic bonito is distributed in the tropical and subtropical Atlantic Ocean, in the Gulf of Mexico, and in the Mediterranean and Black Seas (Collette and Nauen, 1983). In the eastern Atlantic, it is distributed from Oslo (Norway) to Port Elizabeth (South Africa). In the Northwest Atlantic, Atlantic bonito occurs from Nova Scotia to Florida, is present in the northern Gulf of Mexico and apparently absent from most of the Caribbean Sea (Collette and Nauen, 1983). Off the South America Atlantic coast, the species is recorded from Colombia, Venezuela, and south of the Amazon River to northern Argentina.

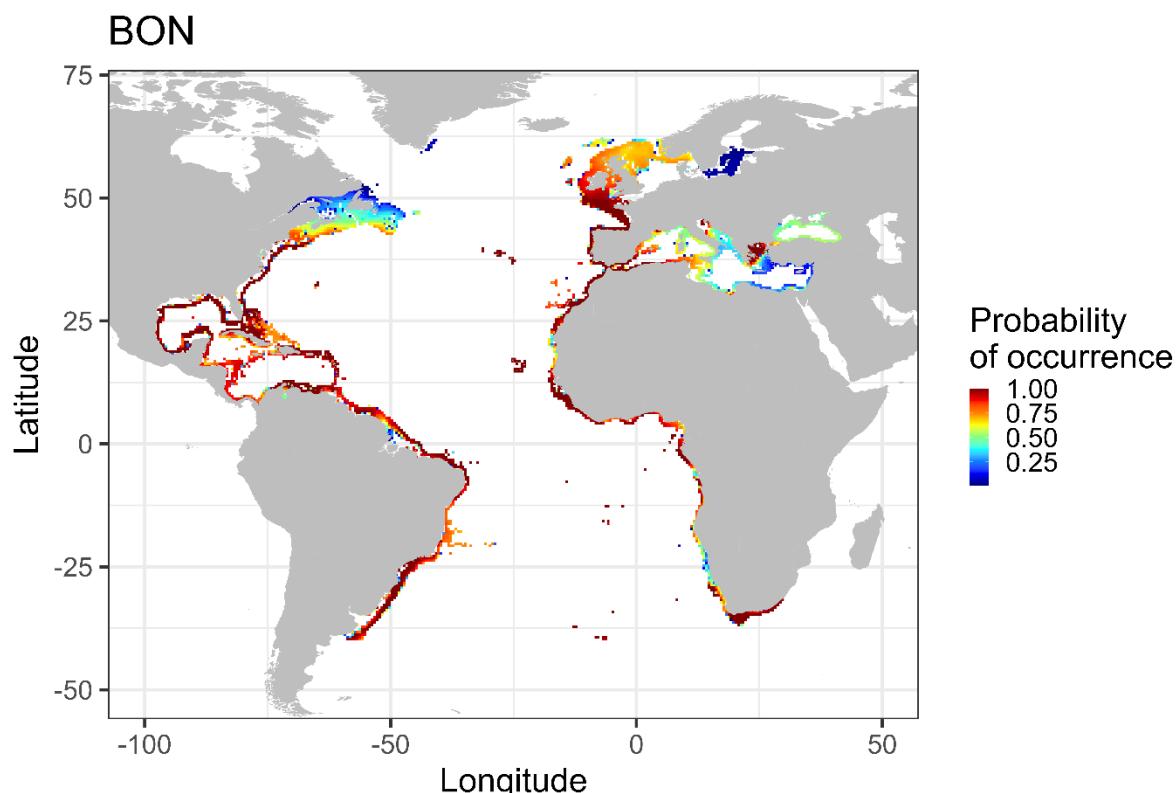

Figure 3. Geographical distribution showing the probability of occurrence of *Sarda sarda* based on data available on FishBase and aquamaps.org website.

3.b. Habitat preferences

Atlantic bonito is an epipelagic and neritic marine fish species which lives in schools along the neritic area and may enter in estuaries. It can be found from 80 to 200 meters in depth (Yoshida, 1980). This species can adapt to different temperatures from 12° to 27°C and salinities from 14 to 39 (Collette and Nauen, 1983; Bianchi *et al.*, 1999).

3.c. Migrations

In general, little is known about bonito migration patterns. Atlantic bonito migrates along the coast for large distances as proved by recaptures of tagged fish in the Black Sea and Alboran Sea (western Mediterranean Sea) (Rey *et al.*, 1984). It is known to migrate along the coast from the Atlantic to the Alboran Sea and from the Aegean to the Black Sea for spawning; after spawning, it migrates taking the opposite route (Nümann, 1954). Some studies suggest that Atlantic bonito is resident in western Mediterranean Sea throughout the year and that mature fish migrate from coastal areas to the open sea to spawn (Sabatés and Recasens, 2001). This species can carry out extensive migrations within its distribution. The average distance covered is around 2.6 km/day but can vary from 0.2 to 35.6 km/day (Rey *et al.*, 1984).

3.d. Recruitment

Knowledge of the early life stages for Atlantic bonito is very scarce. It is assumed that the larval period is short. The beginning of the juvenile period has been established arbitrarily as to sizes escaping from plankton nets, around 2 cm (Bard, 1981). Rodríguez-Roda and Di Centa (1980) have found Atlantic bonito larvae in the northeast Atlantic on the Moroccan coast. During the first life stages bonitos are not caught and juvenile life history is unknown. Immature fish first appear in fishery from around 15 cm of fork length (Zengin *et al.*, 2005).

4. Biology and life history parameters

For this manual and species, 5 stocks unit areas, previously defined by ICCAT for data collection and management purposes, were considered to summarize the results: Southwest Atlantic (SW), Northwest Atlantic (NW), Southeast Atlantic (SE), Northeast Atlantic (NE) and Mediterranean Sea (MED).

4.a. Growth

Atlantic bonito age determination and growth have been studied by different methodologies: otoliths, vertebrae, spines and size frequency. The maximum reported age is 5 years (Cayré *et al.*, 1993). The growth is extremely rapid during the first year, and slows after the fish have reached size at first maturity (approximately 40 cm FL). Most of the studies are from Mediterranean stocks and only a few are from the other parts of the Atlantic Ocean. There are several studies on growth biology of bonito in the Black Sea and western Mediterranean. Von Bertalanffy growth parameters are showed in **Table 1** for different areas.

Table 1. Growth parameters for Atlantic bonito (L_∞ in cm, K in y⁻¹, t₀ in y). Southwest Atlantic (SW), Northeast Atlantic (NE) and Mediterranean Sea (MED).

4.c. Conversion factors

There is a lack of information on this topic.

4.d. Reproduction

- *Spawning*

Atlantic bonito is a multiple spawner with asynchronous oocyte development that carries out 3 or 4 spawning batches by reproductive season (Mayorova and Tkacheva, 1959; Rey *et al.*, 1984). The spawning grounds are typically in coastal areas during the warmer seasons of the year. In the Mediterranean, there are several areas of spawning: Balearic area, Algerian coasts, Sicilian coast, Aegean Sea and Black Sea (Dardignac, 1962; Rodríguez-Roda and Di Centa, 1980; Sabatés, 1990; Sabatés and Recasen, 2001; Čikeš Keč, *et al.*, 2019).

40.0	NE (Morocco)	Females	Dardignac, 1962
45.0	NE (Morocco)	Males	Dardignac, 1962

- *Sex ratio*

The sex ratio has been studied for the Mediterranean and there is a 1:1 sex ratio. However, a higher presence of females in the larger length classes has been noted (Macías *et al.*, 2005).

- *Fecundity*

This species is a fish with indeterminate fecundity (Macías *et al.*, 2005). In the Mediterranean, the average fecundity is 79,432 oocytes by spawning batch, while the total annual fecundity estimates range from 304,000 and 1,150,000 oocytes (Macías *et al.*, 2005).

4.e. First life stages

Eggs and larvae

Eggs are pelagic, 1.15-1.57 mm in diameter and with a variable number (1 to 9) of oil globules (0.28-0.36 mm in diameter when single, 0.02-0.24 when multiple). The yolk is homogeneous. The hatch size is 4 mm. Larvae present pigmentation on tips of jaws, forebrain, midbrain, gut, cleithral symphysis, ventral margins of tail, usually over hypural plate area and P₂ rays (Richards, 2005).

4.f. Diet

Adult Atlantic bonito prey on schooling sardine, anchovy, mackerel and other small pelagic fishes. Main food species reported in eastern Atlantic and Mediterranean Sea: *Engraulis encrasicholus*, *Sardina pilchardus*, *Sardinella sp.*, *Spratella sprattus*, *Ammodytes cicerellus*, *Scomber scombrus*, *Scomber japonicus*, *Trachurus mediterraneus*, *Trachurus trachurus*, *Mullus barbatus*, juvenile *Sarda sarda*, *Atherina spp.*, *Boops boops* and *Caprella*, *Penaeus sp.*, *Euphausia spp.* (Yoshida, 1980). Main species reported in western Atlantic are: clupeids, *Peprilus paru*, *Leiosomus xanthurus*, *Anchoa sp.*, *Scomberomorus sp.*, *Prionotus sp.*, *Loligo sp.*, *Penaeus sp.* and squid (Bigelow and Schroeder, 1953; Boschung, 1966). Atlantic bonito searches for its food early in the morning and evening, generally in the coastal zone (Postel, 1954). The species predators are *Acanthocybium solandri*, *Coryphaena hippurus* and *Sarda sarda*.

4.g. Physiology

There is a lack of information on this topic.

4.h. Behaviour

Atlantic bonito form schools of variable dimensions. The more coastal schools are comprised of small individuals. The schools are mixed, composed of spotted tunny and auxid, or monospecifically formed of Atlantic bonito of the same size. Schooling around flotsam is observed in Senegal (Diouf, 1985). The schools can break up and original individuals from the same school and age class could be found in 2 different schools 600 miles apart (Rey, 1983).

4.i. Natural mortality

Rey (1983) have estimated natural mortality at 1.32 year⁻¹ in the Northeast Atlantic using tagging data. However, Pons *et al.* (2019a) estimated natural mortality empirically through different methods and reported a value of 0.78 year⁻¹ and 0.83 year⁻¹ for the Northeast Atlantic and Mediterranean, respectively.

4.j. Stock structure

There are no clear stock boundaries defined for small tunas species in the Atlantic Ocean. However, the SCRS considers five stocks unit areas, which were previously defined by ICCAT for data collection and management purposes: Mediterranean Sea (Med), Southwest Atlantic (SW), Southeast Atlantic (SE), Northwest Atlantic (NW) and Northeast Atlantic (NE). Rey *et al.* (1984) showed that there is mixing between Atlantic bonito populations from the western Mediterranean and the Northeast Atlantic. Recently, Viñas *et al.* (2020) found a clear genetic heterogeneity among the eastern Atlantic and Mediterranean Sea populations. The genetic isolation of Atlantic bonito was previously noted within the Mediterranean (Viñas *et al.*, 2004) and between the east Mediterranean and Black Sea (Turan, 2015) and between both sides of the Atlantic Ocean (Viñas *et al.*, 2010). These studies suggest that Atlantic bonito might have multiple stock units in the Atlantic Ocean and Mediterranean Sea.

5. Description of fisheries

Since 1950, the total reported catches of Atlantic bonito have been oscillating with an average around 30,000 t, with strong peaks along the time series, some years reaching more than 50,000 t landed (**Figure 4**). In general, most of the catch come from Mediterranean Sea, accounting for ~ 65% in average of the total landed catch between 1950 and 2019 (**Figure 4**). Landings from the Northeast Atlantic have been increasing since the mid 1990s up to the last decade with a notable increase in 2019, when almost 20,000 t were landed, becoming the most important area with 67% of the total catch in the Atlantic Ocean and Mediterranean Sea. On the other hand, landings of Atlantic bonito in the western and Southeast Atlantic are considerably lower in comparison to the Mediterranean Sea and Northeast Atlantic (**Figure 4**).

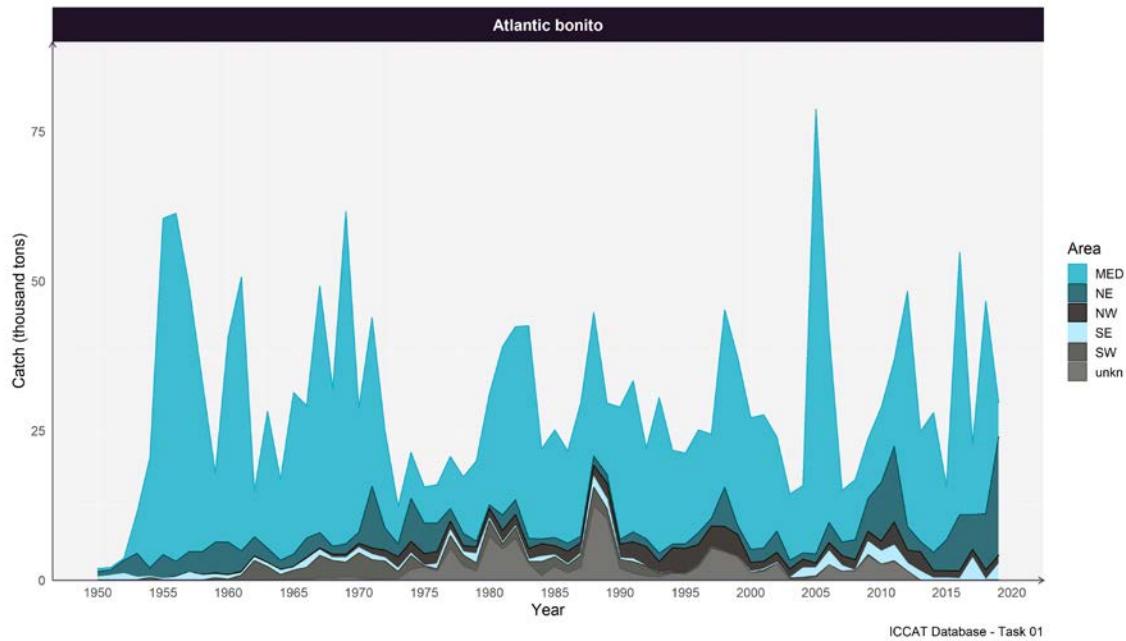

Figure 4. Catch of Atlantic bonito available in the ICCAT database by region from 1950 to 2019.

Atlantic bonito is exploited mainly by coastal fisheries and often by artisanal fisheries, including purse seiners, handlines, small-scale longlines, and a wide variety of nets, especially, gillnets and trammel nets. Most of the catch come from unknown fishing gears (**Figure 5**), particularly at the beginning of the time series in all five areas. In the Mediterranean Sea, purse seine fisheries are the most important fishing gear in terms of landings (**Figure 5**). In the Northeast Atlantic, most of the catch is under the category “others” and includes a wide variety of fishing gears, while in the Northwest Atlantic, catches are dominated by longline fisheries. In the Southeast Atlantic, gillnet fisheries are the most important with 48% of total catch in the last decade. For the Southwest Atlantic, catch reporting has decreased to extremely low levels and landings have been mainly reported by the longline fisheries in the last decade (**Figure 5**).

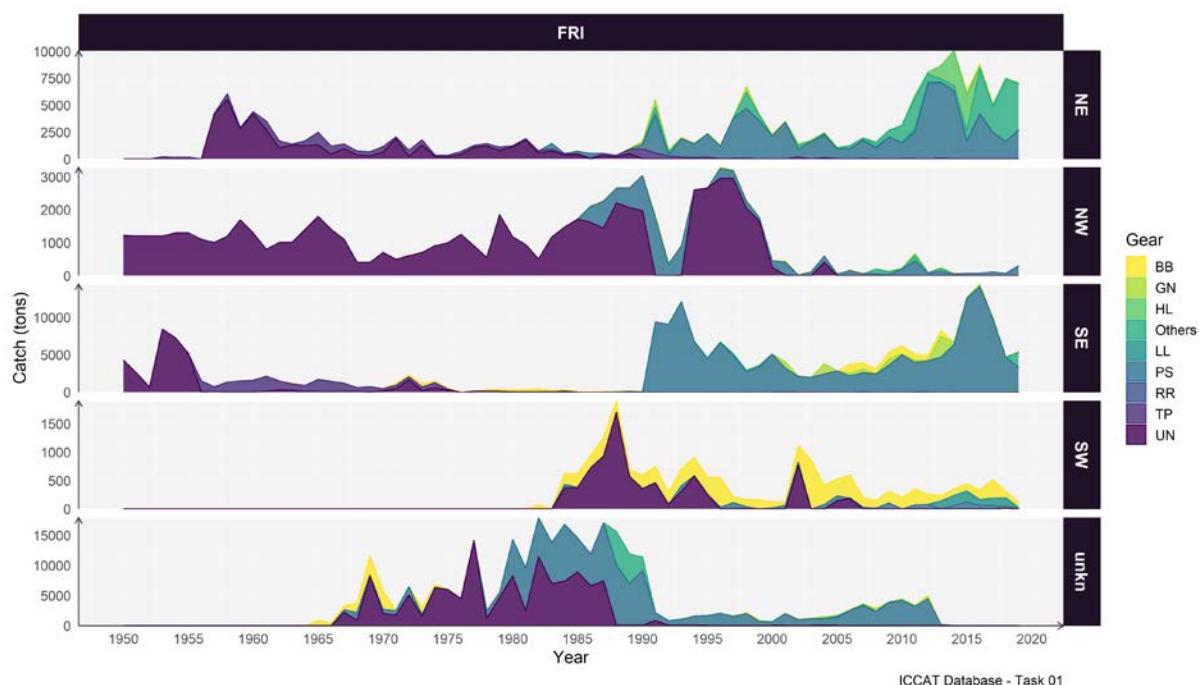

Figure 5. Total catch of Atlantic bonito by ICCAT region and fishing gear. TP: traps. RR: rod and reel. PS: purse seine. LL: longline. HL: handline. GN: gillnets. BB: baitboat. UN: unknown. Others includes: trawl (TW), trolling (TR), haul seine (HS), trammel net (TN), sport (SP), tended line (TL), and harpoon (HP).

6. Description of size composition

There are no estimates of catch-at-size or catch-at-age for Atlantic bonito. However, there is a relatively large sample size from the main fisheries available in the ICCAT Task 2 size data base. In general, size samples are not well represented throughout its distribution, with the largest number and spatial coverage of sampling in the eastern Atlantic and the Mediterranean Sea (**Figure 6**). The largest specimens of Atlantic bonito occurred in the Gulf of Mexico, but size data from the Northwest Atlantic is represented only by rod and reel with a slight recent decrease reported (Lucena-Frédu^o *et al.*, 2021). In the Northeast, mean sizes varied from 38 to 60 cm and is relatively stable over the overall period with an overall mean of 50 cm FL for all gears combined (**Figures 6** and **7**). Most of the data comes from gillnet, handline, trapping, trolling and trawl fisheries (Lucena-Frédu^o *et al.*, 2021). On the other hand, Atlantic bonito in the Mediterranean Sea presented an overall declining trend in mean size from 2000 onwards (**Figure 7**), particularly for the longline fishery (Lucena-Frédu^o *et al.*, 2021). Although Atlantic bonito size data in the Southeast Atlantic are very spread across time, a relatively stable trend can be observed (**Figure 7**).

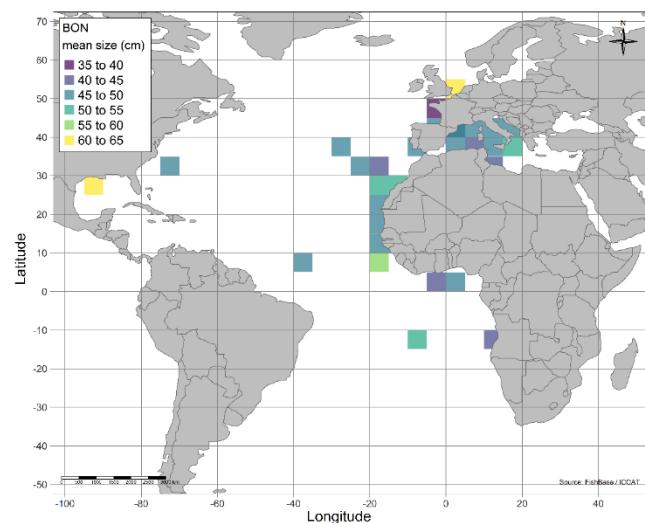

Figure 6. Mean size of Atlantic bonito, in each quadrant of 5x5° between 1979 and 2019.

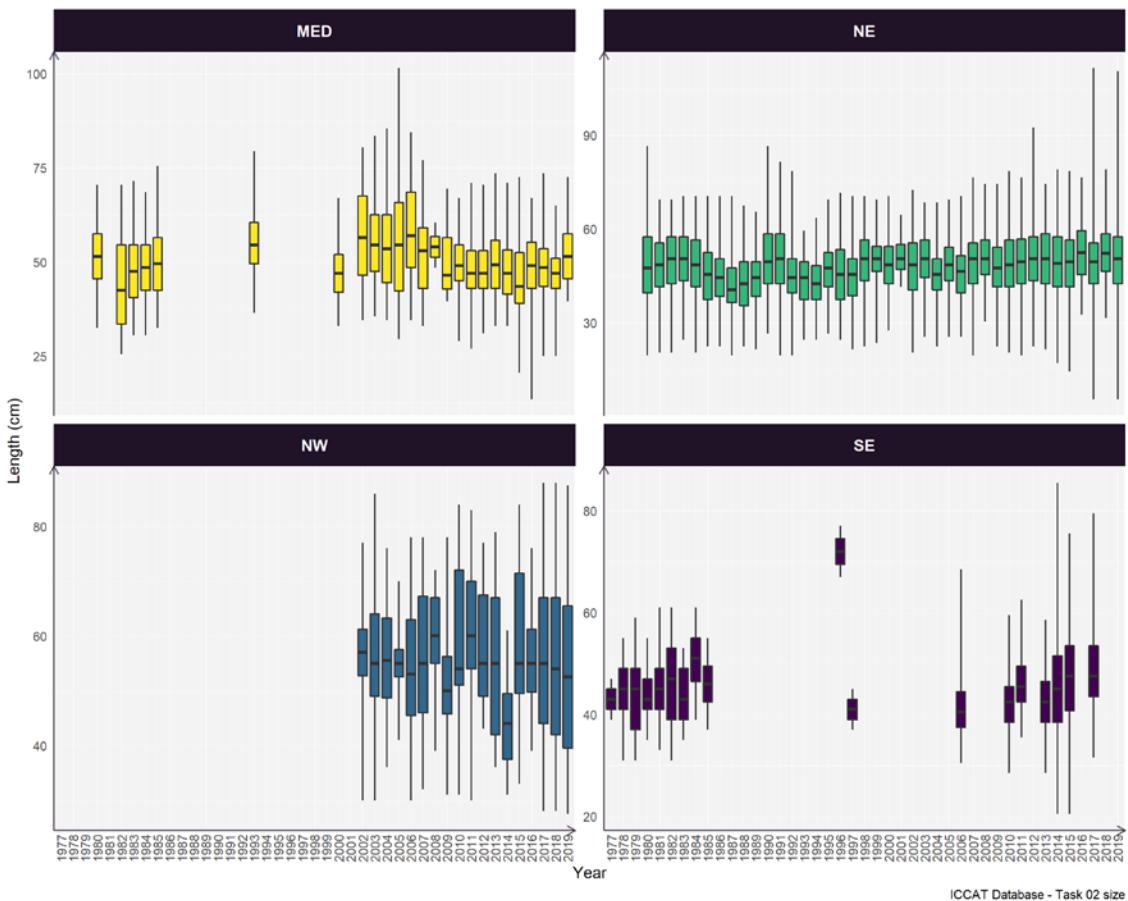

Figure 7. Length data for Atlantic bonito in the Atlantic between 1977 and 2019.

7. Stock assessment

Results from data-limited stock assessment methods showed that the stock status of Atlantic bonito in the Mediterranean and Northeast Atlantic is highly uncertain, as denoted by some conflicting results between the assessment models (Pons *et al.* 2019 a and b). Petukhova (2020) using a length-based model with Russian fishery-length data, found that Atlantic bonito in the Northeast Atlantic is experiencing overfishing with an estimation of spawning potential ratio of 0.28.
