

# \$500 REWARD

Offered for implanted archival tags from Atlantic bluefin tuna

## Archival tags will be implanted in juvenile bluefin tuna beginning June 2005

**Juvenile Bluefin CO-OP Tagging Project:** Starting in June, 2005, archival tags will be implanted in juvenile bluefin tuna by a team of scientists from the University of New Hampshire, Virginia Institute of Marine Science, and Massachusetts Division of Marine Fisheries, working with recreational and commercial fishermen. The research will help determine the migration patterns of northwest Atlantic bluefin tuna in support of trans-Atlantic research prioritized by the International Commission for the Conservation of Atlantic Tunas (ICCAT).

## Description of tag

Implanted archival tags are small data loggers that are placed inside the fish, either in the dorsal side (back muscle) or ventral side (belly cavity). Each logger has a long, thin light stalk projecting out of the fish. Tag sensors record depth, temperatures (of fish muscle and water), and light. The only way to recover the data from these tags is with your cooperation.

*If you capture a bluefin showing the light stalk and/or green streamer tag follow the instructions below.*

## How do I get my reward?

- We would like to get back the whole fish (if possible), but fish must be intact.
- Tagged fish could be undersize, BUT even so, keeping the tagged fish (with its archival tag in place) will NOT count against your daily catch limit; NOAA Fisheries enforcement personnel have been so informed.
- If keeping the whole fish is not an option, PLEASE DO NOT CUT THE LIGHT STALK OFF, but carefully remove the entire implanted archival tag with its light stalk (DO NOT CUT or PULL on the STALK).
- Stow the data logger tag and any ID streamer tag in a safe place.
- Please note the date, catch location, sea surface temperature, and length and weight of the fish. All information is important.

*Please call us immediately.*
