

**SECRETARIAT REPORT ON
STATISTICS AND COORDINATION OF RESEARCH IN 2017**

Introduction

The activities and information included in this report refer to the period between 1 December 2016 and 13 October 2017 (the reporting period)¹. All the basic fisheries, biological statistics and compliance related information have been presented by the Secretariat to the SCRS Working Groups during SCRS inter-sessional and species meetings. The Secretariat continues to note the continuous improvements in terms of data submission using the ICCAT electronic forms. Regarding the activities conducted by the Secretariat in the most recent years, in addition to the normal activities developed on statistics, publications, data funds management and others, the Secretariat is dedicating (apart from the usual preparation of the majority of the datasets required by each assessment) a lot of additional work to stock assessment activities, whether participating actively in the assessment or coordinating and managing external support to the SCRS work. Also, the statistical work requested to the Secretariat in the last five years, together with a common lack of adherence to deadlines established for data provision, particularly special requests for stock assessment purposes, have constituted an enormous amount of work for the Secretariat. This was particularly true in 2017 where there was an unprecedented number of SCRS meetings, which is not sustainable.

1. Statistical and biological information reporting status

The ICCAT Circular #0671/17 from 6 February 2017 established the provisions for reporting fisheries and biological data to ICCAT. The reception date of each email (with the respective files attached) was adopted as the official submission date of the Contracting, Cooperating Party, Entity or Fishing Entity (CPC). The deadlines for the intersessional meetings (all requiring finalised data up to 2015) were: albacore tuna, 5 May 2017; shortfin mako shark, 12 May 2017; Atlantic swordfish, 3 June 2017; and bluefin tuna, 20 June 2017. The general deadline for reporting 2016 statistics (or any required revision to prior years) of all species and fisheries was, 31 July 2017. A tolerance of 24 hours was given to include all the time zones.

A total of 56 ICCAT CPCs (51 Contracting Parties (CP), plus 5 Cooperating non-Contracting Parties/Entities/Fishing Entities (NCCs)) have reporting obligations to ICCAT. For statistical purposes, this corresponds to a total of 74 flag related CPCs (49 CP + 1 CP [16 EU Member States] + 1 CP [4 UK Overseas Territories Member States] + 5 NCCs) who have reported information to ICCAT in recent years. The term “flag CPC” was adopted here to refer to those 74 flags.

The Secretariat used (for the fourth consecutive year) the SCRS filtering criteria (Filter 1 and 2, described in Addendum 2 to Appendix 8 of the 2013 SCRS report, updated by the SCRS in 2016) to validate and accept statistical data received under official formats. The filtering rules are also included in the electronic forms.

For 2016 data, Filter 1 was effectively applied and the results are presented in the SCRS Report Cards (**Tables 1, 2, 3, 4, and 5**, with a summary in **Figure 1**). The “orange” cells indicate the datasets that have not passed Filter 1. However, the majority of the rejected datasets were corrected afterwards by the Secretariat, and provisionally (marked for revision) integrated into the ICCAT database system (ICCAT-DB). Filter 2 was used for testing purposes and the results presented to the SCRS. Both filters were used on every Task I and Task II dataset received (scenario 2, methodology described in Palma and Gallego, 2015²). The filtering criteria was not applied to the tagging forms as the Secretariat does not yet have the necessary conditions to apply them on tagging datasets (corresponding databases and duly automated forms).

¹ Only data received by the Secretariat in valid formats (version 2017 of the electronic forms, or special formats) and within this period was considered in this report. Information submitted afterwards is not referred to in the report.

² Palma C. and Gallego J.L. 2015. Results of applying Filters 1 and 2 to the 2013 statistical data reported during 2014. ICCAT Col. Vol. Sci. Pap. 71(6): 3070-3084.

As planned in 2016, nearly 80% of all of the "ST" type statistical forms received (numbered with prefixes: ST01, ST02, ST03 to ST10) during the reporting period (about 950 forms in total) (nearly 90% from ST01 to ST05) were automatically processed (validated and stored), using the new JAVA "automated data processing framework". Currently, the Secretariat is extending this framework to process the remainder of the statistical forms (ST06 under active testing; ST07 through ST10 planned) and also the conventional tagging forms in the future (as soon as database is redesigned and electronic forms TG01, TG02 and TG03 are properly adapted).

Only four flag CPCs have not used the most recent SCRS forms (version: 2017) to report 2016 data. In all cases these CPCs promptly replaced the older forms by the 2017 version. This rule is crucial for a timely and effective data provision to the SCRS and the Commission. Thus, the Secretariat reiterates to the CPCs the Commission's requirement of using the **MOST RECENT** standard electronic forms (up-to-date SCRS requirements) for data submission.

The overall reporting status for 2016, shows that 85% of the 74 flag CPCs (51 with catches: 69%; 12 with no fishing activity: 16%) have reported fisheries and biological information for 2016. No information of any kind was received during the reporting period by 15% of the flag CPCs (10 flags: Brazil, Cabo Verde, EU-Denmark, EU-Lithuania, Gabon, Guinea Bissau, Guinea (Rep. of), Honduras, Mauritania, Sierra Leone), being Brazil and Cabo Verde the ones with the most important recent historical catches.

1.1 Task I

The two datasets of Task I statistics (T1FC fleet characteristics; T1NC nominal catches) provide yearly based global information on (a) fishing capacity (using form ST01-T1FC), and (b) total catches by species (using form ST02-T1NC), being both forms mandatory for all CPCs. The Secretariat reminds that for T1NC, the statistical sampling areas (maps: www.iccat.int/Data/ICCAT_maps.pdf) are now mandatory (being optional the "old" Task I area codes without geographical boundaries).

1.1.1 Fleet characteristics (T1FC)

The information requested in form ST01-T1FC has two sub-forms. Sub-form ST01A is used to compile information by individual vessel. Sub-form ST01B (optional), is used to compile information by groups of vessels, but only for small scale vessels (length overall less than 20 meters) not included in ST01A. The Secretariat reminds that, only the fishing vessels actively fishing (positive effort) in a given year should be reported in this form.

This new structure (adopted in 2015) allows to collect more complete and detailed information on effective fishing capacity, fleet structure, and optionally (except for the eastern Atlantic bluefin stock), yearly based and gear independent nominal effort (fishing days). The "optional" condition of reporting the nominal effort (only about 50% of the flag CPCs are now reporting fishing days) makes it impossible to obtain overall effort indicators and can compromise valid estimations of total fishing capacity. This is because, the fishing days (in both the Atlantic and Mediterranean regions), is the unique indicator that allows to differentiate inactive vessels from vessels that effectively fished in a given year in the ICCAT Convention area. By making this field obligatory (as for 2014 data), ICCAT will drastically improve the quality and the potential utilization of this information.

The T1FC Report Card for 2016 is presented in **Table 1**. For the third consecutive year (2014 to 2016) T1FC was requested on an individual vessel basis, in line with the ICCAT vessel record requirements of the Commission (now with the same 11 authorisation lists), which facilitates the cross-validation process. The Secretariat reminds that, this information is also used by the Commission (fulfils the requirements under Rec. 15-08, which collects previous year vessel activity under some ICCAT fisheries (BFT-E, tropical species, and, SWO-M). Preliminary summary tables of T1FC were published in Section 6 of the ICCAT Statistical Bulletin (www.iccat.int/sbull/SB43-2-2017/s6.html).

The overall reporting ratio of ST01 for 2016 increased slightly to 72% (53 flag CPCs), with 6 flag CPCs having late submissions. Corrections were made to the information reported by 2 flag CPCs, and 13 invalid forms (no corrections possible) are waiting for a complete revision. The total number of vessels reported as being actively fishing in the ICCAT Convention area (all fisheries) between 2014 and 2016 (preliminary values, and after eliminating possible duplicates), amounted to around 13,000, 12,000 and 7,000 vessels, respectively (2016 still preliminary and incomplete). The vessel size (length overall) ranged from 4 to 220 meters (including the small scale vessels reported in sub-form ST01B by five flag CPCs). About 15% of the vessels reported in T1FC were not found in the ICCAT vessel record (with about 50,900 vessels registered). Some cases could be related to errors in vessel characteristics (as seen in 2014 and 2015).

1.1.2 Nominal catch (T1NC)

Task I nominal catch data (T1NC) which contains landings and discards by species, stock, gear, fleet and year (all in live weight), is a “key” dataset used in all the stock assessments. Thus completeness and timely availability datasets are essential for the SCRS studies. The T1NC (form ST02-T1NC) compiles fishery statistics using two sub-forms. Sub-form ST02A, compiles positive catches (separating landings, dead discards, and live discards). Sub-form ST02B, compiles a “zero” catch matrix (by major species/stock and gears) of active gears (positive probabilities of catching species) that have operated within a year. This approach, resolved by the Commission (Res. 15-09), has greatly normalised and simplified the “zero” catch reporting obligation. Only one “zero” is now required per major species/stock and gear (active only) combination.

The T1NC Report Card for 2016 is presented in **Table 2**. It contains only the CPCs reported data (not the SCRS estimations) in both sub-forms (positive catches and “zero” catches). A summary of the “zero” catches reported by flag CPCs and major species/stocks is presented in **Table 14**. All the T1NC datasets received from 63 flag CPCs (85% reporting ratio), including the 6 flag CPCs with late-reports, was processed and presented to the SCRS. This includes some datasets corrected by the Secretariat (orange cells, marked for revision) associated to 9 flag CPCs. Only 11 flag CPCs (15%), have not yet reported this information. The total T1NC nominal catches (all species, gears, and fleets) reported (736,800 t) surpasses by about 7% the average of the last five years (685,600 t), noting that two important flag CPCs have not yet reported T1NC statistics.

1.2 Task II

Task II statistics (catch-effort and size information) are more detailed in terms of time (month) and area (1x1, 5x5, or, sampling areas), and often they reflect a partial coverage of the total production (Task I catches). Task II information is the main source of data used by the Secretariat to estimate important datasets (CATDIS, EFDIS, CAS, and CAA by species) used by the SCRS and the Commission. ICCAT CPCs must report three types of Task II information under their respective electronic forms:

- T2CE (catch & effort): using form ST03-T2CE,
- T2SZ (size samples): using form ST04-T2SZ,
- CAS/T2CS (catch-at-size): using form and ST05-CAS (only for: ALB, BFT, BET, YFT, SKJ, SWO)

Alternatively, using any of the special agreed formats convened by the Secretariat and a particular ICCAT CPC. There is also a special form (ST06-T2FM) used to report bluefin tuna harvested on farming facilities. These datasets which have been compiled can be considered a special type of Task II size information. However, this information is treated separately (given the growth on the farms) and not used directly in stock assessments.

Frequently, confusion arises with the CAS acronym used in the two cases. To refer to the overall species based catch-at-size estimations (CAS) made by the Secretariat (all flags all years) and used in the stock assessments, and, the CPC based catch-at-size estimations (CAS, also identified by T2CS) reported in form ST05-CAS. To avoid misunderstandings and nomenclature conflicts, the Secretariat recommends that form “ST05-CAS” be renamed to “ST05-T2CS”. In this report, the acronym “T2CS” is used to refer to both the dataset CAS/T2CS and the ST05-CAS/T2CS form.

1.2.1 Catch and effort

The T2CE Report Card for 2016 is presented in **Table 3**. With the exception of 9 forms (invalid and requiring revisions), all the T2CE information received was duly processed. A total of 56 flag CPCs (76% reporting ratio), including 7 late-reporting flag CPCs, have reported T2CE. No information was yet submitted by 20 flag CPCs.

All the information stored, arrived on a monthly basis, and the majority of it included the geographical resolution required by the SCRS (1x1 or better for surface fisheries, and, 5x5 or better for longline fisheries). The number of datasets reported with the exact geographical location (Latitude/Longitude) continues its slow increasing trend. The number of species reported in T2CE datasets has also increased lately, in particular the pelagic shark species. This tendency to report more detailed and complete T2CE has been continuous in the most recent years. The T2CE datasets without information on effort were not integrated into ICCAT-DB, and requests for revision are planned.

The Secretariat has an ongoing T2CE data recovery task (over the last 6 years), aiming to complete identified gaps, and to replace (explicit CPC data requests) “poor” datasets by the ones recommended by the SCRS (effort completed, by month, and, 5x5 for longline gears/1x1 for surface gears). This task should continue in the future, and the Secretariat recommends a more active collaboration of CPC scientists and Statistical Correspondents.

An important part of the Secretariat estimations (CATDIS, EFFDIS, CAS and CAA) depends on the quality of T2CE. However, some deficiencies/problems persist in some datasets reported, being the most problematic ones: a) non-standard effort types for certain gears (e.g.: for longline “hooks” is the standard); b) incomplete/partial species catch composition; c) double counting of fishing effort (same effort reported several times in different forms for the same gear, often linked to case (b) deficiencies). There is no simple way to merge two T2CE related datasets (same fleet/gear/year), in particular the effort quantities, with partial species catch compositions and sometimes with different geographical stratification. The Secretariat recalls that, as recommended by the SCRS several years ago, T2CE statistics should always be reported with the most complete (as much as possible) species catch composition, with total independence of the SCRS meeting requiring T2CE information.

1.2.2 Size information

The Task II size data Report Card for 2016 is presented in **Table 4**. This report card has also merged the T2CS (only for the six mandatory species) datasets (this point forward, T2SZ refers to both size datasets: T2SZ and T2CS). However, it does not yet contain the bluefin tuna size samples included in form ST06-T2FM, neither the BFT stereoscopic camera measurements. The main reason has to do with the fact that currently, neither of the two datasets have all the required conditions (formats, databases, forms, import/validation code, etc.) to be merged in the Report Card automatic generation process. The inclusion of these two datasets in the T2SZ Report Card is made by hand (after check and merging all the datasets arrived in common structures).

A total of 52 flag CPCs (70% reporting ratio), including 5 CPCs with submissions after the deadline, have reported T2SZ data. With the exception of 43 forms (35 ST04 forms and 8 ST05 forms) all the T2SZ forms passing filter 1 (no corrections made) were validated and stored in ICCAT-DB. Some of the pending T2SZ forms can be corrected (more green cells will appear) if the sufficient time is available. The submission of T2SZ information is pending from 22 CPCs.

The Secretariat noted a reasonable improvement in the time resolution (except the datasets from two CPCs, which all arrived stratified by month), and in the use of smaller geographical grids (nothing reported in 10x20 and 20x20 squares). These improvements respond somehow to the 2016 SCRS discussions (Species Groups, and Sub. Com. on Statistics) involving the need to improve the detail and harmonise all the Task II datasets. Among others, those discussions focused on two important aspects: i) The need to adopt a common and unique time resolution (month); ii) The need to reduce the available options on geographical grids (drop large grids: 10x20 rectangles, 20x20 squares), noting that sampling areas should be kept for biological port sampling. This discussion was postponed to 2017 for a final deliberation. Given the improvements noted during the last two years, the Secretariat recommends to adopt the “month” as the unique time resolution in all Task II datasets, and, for T2SZ/T2CS to eliminate

large grids (10x20 and 20x20) and limit the geographical stratification to smaller grids (1x1, 5x5, 5x10, and, 10x10) and the ICCAT Sampling Areas for port sampling. The size/weight class bins reported for 2016 have followed the SCRS recommendation on size structures (1, 2, and, 5 cm) and weight structures (1 kg). Only one CPC has reported information outside (>5 cm) those structures (files under revision).

Following the Commissions Res. [11-14] on the standardized presentation of scientific information, the Secretariat is providing a “catalogue summary” for each of the major species by stock/management unit (**Appendix 1**). These catalogues show the information for a given period (1996 to 2016), grouped by flag/gear group combinations in terms of Task I nominal catches, Task II catch and effort, size sampling, and catch-at-size data available by year. The objectives are summarizing data completeness and availability for each stock and identifying major gaps of information. In **Appendix 1** the catalogues are provided for the nine major tuna and billfish species and three main sharks stocks (excluding the small tuna species catalogues, which are presented during the WG-SMT meetings). Each table data has the flag/gear group combinations ranked by importance (the average catch over this time period) and arranged in descending order. For presentation purposes, the list is restricted to the top flag/gear group combinations that account for at least 95% of the total cumulative Task I nominal catches over the time period shown.

For the first time, the Secretariat presented (preliminary study, SCRS/2017/P/044) a “scoreboard” on data (Task I and Task II) availability for all the major ICCAT fisheries (1 catalogue per fishery shown in the 27 tables of **Appendix 1**). Each catalogue, containing a given set of years (21 chosen), is scored with a function that takes into account:

- i. The importance of each fleet component (flag/gear combination) in the total catches of all those years (only the fisheries that cover about 95% of the overall catches are considered), and,
- ii. The availability of various Task II datasets (T2CE, T2SZ, and T2CS whenever required) within each year and across all the period considered.

This quantitative score (real numbers between 0 and 10) concentrates in a unique value the entire catalogue of a given fishery. The scoreboard with preliminary results is presented on the first page of **Appendix 1**. This ongoing study (search of score functions to systematically quantify data availability) should continue during 2018 as recommended by the SCRS.

1.3 Tagging

1.3.1 Electronic tags

The laboratories conducting tagging campaigns with electronic tags (pop-up, archival, etc.) in the Convention area have informed the Secretariat of 251 releases 72 recoveries made in late 2016 and during 2017.

1.3.2 Conventional tags

During 2016-2017, several Contracting Parties have reported the tagging of 2,563 fish with conventional ICCAT tags, and 386 recoveries (**Table 6**).

As in previous years, the Secretariat provided conventional tags for tagging experiments to the ICCAT scientific community (individual scientists or research institutions of the CPCs). From September 2016 to September 2017, the Secretariat distributed 3,425 conventional tags, primarily under the tagging projects of the ICCAT GBYP and to various scientific institutions (**Table 7**).

The update of the forms TG02 and TG03 (making a single form trilingual, updating the format and reviewing the fields to be completed, including mandatory information), conventional and electronic tagging respectively, will be subject to the orientation provided by the *Ad hoc* Working Group on coordination of tagging information to the Secretariat as regards the recommendations to initiate the procedure (a similar process to that carried out for form TG01, from developing drafts of these forms to final approval).

1.3.3 Tagging lottery

National laboratories award prizes or give gifts to people who recover tags to encourage the return of recovered tags. In support of these programmes, ICCAT organizes on a yearly basis a lottery carrying prize money of \$500.

The 2016 draw contained several new features including the launch of a new programme mid-year: the Atlantic Ocean Tropical Tuna Tagging Programme (AOTTP), and the category of tropical/small tunas became exclusively small tunas. The reason for this is that the AOTTP will sponsor an additional lottery, in which a cash prize of €500 will be awarded for each large species in the tropicals category (*Thunnus albacares/YFT*, *Thunnus obesus/BET* and *Katsuwonus pelamis/SKJ*). In the first small tunas only draw, all the tags were from the AOTTP.

In the latest ICCAT draw, which was held on 3 October 2016, prizes were awarded for three tags for each of the following categories: small tunas, billfish and sharks, respectively.

The winning tags were as follows:

- Small tunas: The winning tag carried the number ATP006300, and was recovered from an Atlantic black skipjack (*Euthynnus alletteratus/LTA*) by a crew member of a Senegalese vessel, 30 days after it was attached. The tagging was carried out during the Spanish campaigns.
- Billfish: The winning tag carried the number CR008829, and was recovered from a swordfish (*Xiphias gladius/SWO*) by a Spanish citizen, 3609 days after it was attached. The tagging was carried out during the Spanish campaigns.
- Sharks: The winning tag carried the number 352442, and was recovered from a blue shark (*Prionace glauca/BSH*) by a Spanish citizen, 921 days after it was attached. The tagging was carried out during the United States campaigns.

This year, in the temperate tunas category, tags were only recovered from bluefin tuna (*Thunnus thynnus/BFT*). Given that since 2012 this species has its own draw linked to the ICCAT Atlantic Wide Research Programme for Bluefin Tuna (GBYP), this category did not feature.

In 2016, once again, the additional draw took place which is supported by the ICCAT Atlantic Wide Research Programme for Bluefin Tuna (GBYP). This draw carries three prizes, two for €500 and one for €1,000 for recoveries of bluefin tuna tags (*Thunnus thynnus/BFT*) only. The winning tags and their rewards were as follows:

- €1,000: the winning tag carried number BYP072069, and was recovered by a Croatian citizen.
- €500: the winning tag carried the number CR012327, and was recovered by a Maltese citizen.
- €500: the winning tag carried the number BYP074997, and was recovered by a Canadian citizen, 20 days after it was attached. The tagging occurred during the Canadian campaigns.

As mentioned earlier, this year for the first time the additional draw took place supported by the ICCAT Atlantic Ocean Tropical Tuna Tagging Programme (AOTTP). The draw carried a cash prize of €500 for each of the main species in the tropicals category. The winning tags and their rewards were as follows:

- Bigeye tuna (*Thunnus obesus/BET*): the winning tag carried the number ATP010175, and was recovered by a crew member of a Spanish vessel, 27 days after it was attached. The tagging was carried out during the Spanish campaigns.
- Skipjack (*Katsuwonus pelamis/SKJ*): the winning tag carried the number ATP008596, and was recovered by a crew member of a Spanish vessel, 33 days after it was attached. The tagging was carried out during the Spanish campaigns.
- Yellowfin (*Thunnus albacares/YFT*): the winning tag carried number ATP010669, and was recovered by a crew member of a Spanish vessels, 30 days after it was attached. The tagging was carried out during the Spanish campaigns.

1.4 By-catch

For the third year, the majority of by-catch data was requested to be submitted using the adopted ST09-NatObPrg form. As this form (with 5 sub-forms) is extremely complicated and require substantial work on the part of CPCs to complete, in 2016 the Sub-Committee on Ecosystems and the Sub-Committee on Statistics requested that the forms be simplified. The simplification was carried out and presented at the 2017 meeting of the Sub-Committee on Ecosystems. The Sub-Committee made several suggestions and these forms were revised and presented to the Sub-Committee on Statistics in 2017 who endorsed the forms and suggested they be adopted by the SCRS for use in 2018. For 2017, however, the previous forms are considered to be in vigour and thus all submissions in the reporting period utilised the older more complicated forms. For the reporting period, the Secretariat has received submissions using these forms from 16 CPCs (an increase of 2 from 2016), although several forms were submitted with very little information. In addition, the complexity of the forms resulted in several errors in data submission. For example, form ST09D-CatchDetails specifically states "*Note: All catches/interactions should be reported in this form*", while form ST09E-Sampling specifically states "*Note: This form is only for the biological samples and morphometric information. If Form ST09D-CatchDetails is blank, this form will be ignored*". Several CPCs still reported samples in form ST09E, while no catch of these species was reported in form ST09D. In these cases, the information that appears only in ST09E is not included in the following tables as it is unclear if the samples represent the full number of interactions or merely a sub-sample. Information for 67 ICCAT by-catch and shark species were reported using the new forms. The Task I catch data is provided in terms of weight, while ST09-NatObPrg forms allow the submission of data by number as well and so both are provided from this source. **Table 8** provides the ST09-NatObPrg data received during the current reporting period separated by discard fate. Japan and China sent observer information regarding by-catch species but in a non-standard format in addition to their ST09 forms. **Table 9** contains T1NC data for by-catch species. It should be noted that there is overlap between the Task I and observer data numbers. They are not cumulative. Several CPCs have indicated that they provide the catches of by-catch species in their Task I submissions as well as in the ST09 forms.

1.4.1 Sharks

Information was collected regarding shark data improvement towards the implementation of Recommendations [09-07], [10-07], [10-08] and [11-08] in 2012, 2013, 2014, 2015 and 2016. One submission was received in 2017. Task I and II shark data has been submitted in 2017.

1.4.2 Sea Turtles

The Sub-committee on Ecosystems at their 2014 meeting decided to discontinue working on a sea turtle ERA in the short term, however, recognizing that there is a paucity of by-catch data submitted to the ICCAT Secretariat despite repeated requests for this information, the Sub-committee requested that CPCs submit sea turtle by-catch information including data not reported using the ST09 data submission form, and also to estimate total removals using their observer data. All information submitted in 2017 is provided in **Table 10**. The Secretariat received the majority of this information from submitted ST09-NatObPrg forms, although some CPCs submitted information separately using non-standard formats. It is recommended that this information is only submitted using the dedicated observer data collection forms as requested by the Secretariat.

1.4.3 Seabirds

The Secretariat received information on seabird interaction and release fate in the ST09-NatObPrg forms, as was requested since 2016 although the response was generally low. The information submitted is provided in **Table 11**.

2. Data recovery and improvement

2.1 Revisions and updates

Several CPCs have submitted historical revisions to T1NC for tuna and tuna-like species, sharks and other by-catch species. Part of those revisions (mostly bluefin tuna and swordfish) were associated with a joint Secretariat staff/CPC scientists work, aiming to reduce the unclassified gears (UNCL; SURF, etc.) weight in

the total catches series of those species. Some gaps were also completed. This joint effort has greatly contributed to the T1NC improvements of both bluefin tuna and swordfish, and, it should be recommended to the other ICCAT species groups. All the T1NC updates are summarised in **Table 12**. The majority of the revisions (with SCRS documents) were already adopted by the Bluefin tuna and Swordfish species groups. There are however, some official T1NC datasets (presented in **Table 13**) that require a SCRS decision.

For T2CE, the largest revision was presented by EU-France with a revision (1991-2015, by month and 1x1 squares) to the mid-water trawl fishery targeting northern Atlantic albacore. All the datasets (**Table 15**) were provisionally integrated into the ICCAT databases with the pending approval of the SCRS. The T2CE datasets recovered under various ICCAT GBYP historical data recovery projects were already included in the ICCAT-DB system. Some additional work ("coding" to check/adapt the datasets to ICCAT structures) is required before making them available to the general public.

The Secretariat has received additional historical revisions of T2SZ datasets. The major revisions were received from the Chinese Taipei longline fishery (1981-2007 on swordfish, and albacore), Canada handline/harpoon fishery (1975-1982, bluefin tuna), Venezuela longline fishery (1987-2016, swordfish), and, Algeria longline (2000-2009, bluefin). The above datasets (detailed in **Table 16**) were adopted by the respective species groups and integrated into ICCAT-DB. The approval of the SCRS is pending for some.

2.2 By-catch data

In 2016, information regarding Rec. [11-10], par. 3, on the provision of existing identification guides for sharks, seabirds and turtles and marine mammals caught in the Convention Area was provided by China and Turkey. With regard to Rec. 11-08, par. 4, plans for improving data collection for sharks on a species specific level, Turkey provided information during the reporting period. Chinese Taipei provided historic observer information in the ST09-NatObPrg forms for 2014 and 2015. Information on alternative monitoring systems (S11) was provided by Morocco, and Tunisia.

3. ICCAT databases

The ICCAT database information system (ICCAT-DB) is an integrated system that uses a relational database management system (RDBMS) to manage all the structured information (30 databases) received by the Secretariat. The RDBMS adopted was the MS-SQL 2008R2 server. There are various frontend components (client applications developed mostly with Java technologies, SQL scripts, and, some residual VBA tools). Part of these frontend components are used to interact with the information (validation, transformation, processing, statistical analysis, data mining, standard outputs, etc.) and for data dissemination (web, ICCAT publications, meetings, etc.). The RDMBS migration task is ongoing by the Secretariat (from 2008R2 to version 2016) and is expected to be finalised during 2017. The software licences were already purchased.

In addition to the statistical and scientific information managed, the ICCAT-DB system also manages a large portion of the information associated with the Commission's compliance requirements. Since 2009, the workload of compliance-related information (mostly in response to the increase of regulatory measures requiring data handling) steadily increased the database management related tasks.

The JAVA project had two phases. Phase 1 (Mar/2015 to Feb/2016) finalised with the migration of 12 applications and the development of 2 new databases. It was then extended (phase 2) from April/2016 to July/2017, as recommended by the SCRS, aiming to improve the ICCAT-DB system in general (complement specific parts of the applications developed in phase 1, prototyping a statistical online reporting system, complete the automatic data processing framework, capacity building, etc.). All the documentation associated (database manuals, JAVA code manuals ["javadocs"], user guides, etc.) are being properly merged into the "ICCAT-DB documentation framework". With the 2017 Secretariat workload, very little progress was made as regards this matter. However, as it is now a continuous task (live updates), the Secretariat expects (depending on the 2018 scheduled meetings) to spend more time on the ICCAT-DB documentation, focusing primarily on those databases that will have future updates (mostly changes foreseeing the adaptation to the ICCAT fisheries online reporting system).

The Secretariat will continue the improvement work of various databases (statistics, tagging, and, compliance), and also, the ongoing developments (part of it to be deployed in the ICCAT cloud system) on the statistical data online validation/reporting system, web-forms prototyping, web-services (RESTful), and others. The Secretariat is also working on the replacement of the stand-alone MS-ACCESS databases (various limitations) published on the ICCAT website (T2CE: "t2ce.mdb"; T2SZ/CS: "t2sz.mdb"), by SQLite 3.20+ (<https://www.sqlite.org>) databases. The current functionality available in the MS-ACCES databases should be replaced by developing equivalent tools in R (libraries) and JAVA (applications).

3.1 Statistics

3.1.1 Task I and Task II

All the electronic forms used to collect Task I and Task II data (ST01-T1FC, ST01-T1NC, ST03- T2CE, ST04-T2SZ, and ST05-CAS) were updated to version "2017a" to incorporate the required changes of the SCRS (codes, structures, filtering criteria, etc.). The respective databases were updated accordingly.

The automatic data processing framework already reads those five forms (more than a year in production). The Secretariat is currently extending this framework to process the remainder of the statistical forms (ST06 under active testing; ST07 through ST10 planned) and also the conventional tagging forms in the future (as soon as database redesign and electronic forms TG01, TG02 and TG03 are properly adapted). Extending this automatic reading framework to all the "ST" and "TG" form types should occur progressively (2018 and beyond) due to its complexity.

In addition, the Secretariat also expects additional improvements to the ST forms adopted by the SCRS (support for multiple year submissions in form ST01, ST04, and ST05, all the Task II datasets normalised to "month", simplification of the coding system, etc.), and consequently intends to update the forms to version "2018a".

3.1.2 Catch distribution (CATDIS)

The Secretariat has continued to improve the detailed level in CATDIS. A full revision of CATDIS was made available in June 2017 for the nine major species, aimed to include various historical T2CE catch series recovered during 2016 and 2017 and also specific revisions that were made to Task I since the prior version. The resulting maps were published in the ICCAT Statistical Bulletin, Vol. 43(I) (www.iccat.int/sbull/SB43-1-2016/index.html).

In general, the historical T2CE recoveries before 1980 have been poor. Thus, while there is a plan to produce the CATDIS by month, the quality of T2CE before 1980 (incomplete and aggregated by year/trimester) does not yet allow this improvement. The inclusion in CATDIS estimations of four additional species (SPF: spearfish, BSH: blue shark, SMA: shortfin mako; POR: porbeagle) is also pending due to the lack of sufficient information.

3.1.3 Catch at size/Catch at age

The catch-at-size (CAS) database is complete and functional, with an active connection between the size data and the substitution tables used for the CAS estimation. As required, the Secretariat updated the overall CAS estimations for the stocks evaluated by the SCRS in 2017, namely the CAS and catch-at-age (CAA) matrices of north and south swordfish stocks and eastern-Mediterranean and western bluefin tuna.

3.1.4 Effort distribution (EFFDIS)

An update to the EFDIS database was requested by the Sub-Committee on Ecosystems in early 2017. The request was made because general updates in the Task I and II data had become available, and particularly because Japanese historical Task II data had been revised. The Secretariat presented an update of the EFDIS estimations (SCRS/P/2017/032) with the same methodology previously used (Beare *et al.* 2016). EFDIS data were made available by the ICCAT Secretariat as the number of hooks reported by the CPCs in the Task II 'Catch-and-Effort' data submission (HooksObs) and the estimated total effort (HooksEst) in April 2017. Note that the estimated total effort is obtained by using Task I (nominal catches) and the Task II 'Catch-and-Effort' data. In May, a problem was reported in the data relating to the

raising factors for the USA data. This was investigated by the ICCAT Secretariat and a bug was found in the code, relating to the USA longline data which was rectified. The nomenclature used in the final version of EFDIS has also caused some confusion and the Sub-Committee recommended that 'HooksObs' be named 'HooksReported'. It was also noted that in certain cases, the catch available in the Task II data is higher than that in Task I. It was agreed that the Task I catches should always be used for the scaling of the effort as it is the official total catch submission and is likely to be more accurate than the Task II catches.

The current model used to estimate total effort is a GAM from the *Poisson* 'family' which models -using Generalized Cross Validation- the frequency of hooks (count data). Dependence on time is estimated using 'harmonics'; and on space using (2D-spline) smooth functions. Currently 'variance' is estimated from the Standard Errors of the GAMs. The Sub-committee recommended using other techniques or strategies to help model-selection (cross validation) and estimate variance (bootstrapping). The code (effdisR) is all written up as a documented R-package, available upon request from the ICCAT Secretariat. The Sub-committee recommended that cross validation of the regression model be conducted. That is because GAMs can over-fit the data. When this happens, the ability of the model to be used as a predicting tool is diminished.

3.1.5 FAD forms

In 2014, a new form (ST08-FadsDep) was created and distributed in response to Rec. 13-01 par. 2. This form was designed to capture information on the number of FADs actually deployed on a quarterly basis, by FAD type, indicating the presence or absence of a beacon associated to the FAD. This form was modified in 2016 and again in 2017 to include additional information pursuant to Rec. [15-01] and subsequently, Rec [16-01 paragraph 23]. In 2017, the Secretariat has received submissions from three CPCs, namely Belize, the EU, and Ghana. **Appendix 2** shows the information received during the reporting period.

3.1.6 Supply vessels

Another form (ST07-TropSupVes) addressing Rec. 16-01, par. 23 was created to obtain information regarding support vessels and in particular for each support vessel, the number of days spent at sea, per 1° grid area, month and flag State and whether it was associated to purse seine/baitboat. In 2017, the Secretariat has received information from three CPCs, namely Belize, the EU and Panama.

3.1.7 Port Sampling Programme

Form ST10-PortSamp was created in 2015 to compile data and information collected from the sampling programmes covered under Rec. [16-01]. For the reporting period 2016, submissions were received from six CPCs; Canada, EU-France, EU-Portugal, China, Curaçao and Costa Rica that reported no port sampling programs currently, but scheduled for its implementation in the near future.

3.2 By-catch/observers forms

The use of specific electronic Observer Programme Data submission forms were approved by the Commission in 2014 and have been available since 2015. The deadline for data submission using these forms was 31 July and as such the Secretariat has, as mentioned above, received submissions using these forms from 15 CPCs for the current reporting period. It is acknowledged that these forms undergo continuous revision based on feedback by the Sub-committee on Statistics as comments have again been provided by the Sub-committee on Ecosystems in 2017. It is again clarified that all observer data, including by-catch information, should be submitted using these forms. One CPC has also provided historic observer data using these forms. In 2015, a database was initiated to store the data submitted by the ST09-NatObPrg form although, as this form has changed, based on the comments and feedback provided by the SCRS, this database has been discontinued, particularly in light of the substantial changes requested this year. A new database and data input applications will need to be developed once the form is stable.

3.3 Other Stereoscopic cameras size sampling

Since 2014, CPCs start reporting size measures of eastern bluefin tuna at the caging transfers using stereo video camera recording systems. Size and estimated weight data have been received from CPCs with active bluefin tuna farms; EU-Croatia, EU-Malta, EU-Spain, Morocco, Tunisia and Turkey. In 2015, an electronic form (ST06-T2FM) for data input was made available for CPCs to submit the stereoscopic camera size sampling data. Unfortunately, not all CPCs have adopted the e-form, and/or submitted all the information required. In 2016 the SCRS adopted an updated size-weight relationship for bluefin tuna caught ($RWT\ (kg) = 2.8684 \times 10^{-5} * SFL\ (cm)^{2.9076}$) in the Mediterranean Sea during the months of May and June, to be used in the estimation of biomass catches from the stereoscopic size data.

3.4 Compliance

In recent years, a number of compliance-related measures adopted by the Commission include reporting requirements of various kinds on Contracting Parties. The Secretariat maintains databases for these sets of information separately from the traditional fishery statistics (Tasks I and II). Since 2011, following the Commission adoption of the Confidentiality Data Policy, the Secretariat has provided compliance-related information to the SCRS to fill gaps, complement or cross-check fishery statistics. This section of the report summarizes the available data that has been summarized for the SCRS in 2017.

3.4.1 ICCAT Vessel record

The Secretariat maintains up-to-date the ICCAT database on vessel record (Recommendations [11-03], [11-12], [12-03] and [12-06]), which was slightly improved during 2016. The entry into force of more recommendations in 2017 has increased the number of Vessels Registry Lists from 6 to 11 in the ICCAT Record of Vessels. The ICCAT vessel record database is, since 2015, daily synchronised with the t-RFMOs Consolidated List of Authorized Vessels (CLAV) and the electronic Bluefin Catch Documentation Program (e-BCD).

The Secretariat also carries out a continuous revision of the ICCAT vessel record database consistency. Vessel duplication was reduced during the last 4 years, to about 1% (around ~350 possible duplicates) of the total of nearly 49,900 vessels registered. This duplication ratio can only be reduced with the help of the ICCAT CPCs. The Secretariat is also carrying out an ongoing (long term) project aiming to rebuild the ICCAT vessel record history (backwards in time). The history rebuilding project only covers the years prior to 2013 (from 2013 onwards the history is already tracked/stored by the new vessels database).

3.4.2 Bluefin tuna fisheries

Recommendations [14-04], [14-05] and [06-07] establish several reporting requirements for CPCs fishing bluefin tuna:

- List of vessels authorized to catch eastern bluefin (Para. 52 of Rec. [14-04])
- List of other bluefin tuna vessels authorized to operate in the eastern bluefin tuna fishery (Para. 52 of Rec. [14-04])
- Detailed information on bluefin tuna catches in the eastern Atlantic and Mediterranean in the preceding fishing year (Para. 56 of Rec. [14-04] and Para 1 of Rec. [15-08]).
- Weekly eastern bluefin tuna catch reports by vessel and traps (Para. 66 of Rec. [14-04])
- Monthly eastern and western bluefin tuna catch reports by flag (Para. 67 of Rec. [14-04] and Para. 24 of Rec. [14-05], respectively)
- VMS messages (Para. 5 of Rec. [07-08] and Para. 87 of Rec. [14-04])
- List of bluefin tuna traps (Para. 54 and 55 or Rec. [14-04])
- Bluefin tuna farming facilities (Para. 9b) of Rec. [06-07])
- Bluefin tuna farming reports (Para. 5 of Rec. [06-07])
- The use of stereoscopic cameras systems in the context of caging operations (Para 83 and Annex 9, Rec. [14-04])
- List of ports in which vessels are authorized to land and/or tranship eastern bluefin tuna (Para. 59, 63 of Rec. [14-04]).
- Data and information collected under each CPCs observer programme (Rec. 14-04, Para 88)

3.4.3 VMS messages

The VMS information received under [Rec. 14-04] consists of a vessel ID (name, flag, radio call sign) and a position every four hours. This information can, in theory, be used to infer on fishing effort distribution and intensity. **Figure 2** shows the number of messages received in each $1^\circ \times 1^\circ$ rectangle from 17 September 2016 to 13 October 2017 (reporting period). The plot represents only VMS messages that originated at sea.

3.4.4 Bluefin Catch Document (BCD) and electronic BCD

In compliance with Recommendation [11-20], the Secretariat receives copies of bluefin tuna catch documents that are intended to track bluefin tuna from the catch location to the market. **Table 17** summarizes the BCD catches (weight and number) currently available (16 September 2017).

In 2015, both the paper BCD forms and electronic versions were being accepted until the full transition was accomplished. In 2016, with the implementation of Rec. 15-10, the eBCD system became mandatory on 1 May 2016, with some exceptions until 30 June 2016. The substantive provisions of Rec. 11-20 for the paper BCD are applied *mutatis mutandis* to the electronic BCDs.

3.4.5 Bluefin catch reports

Under Recommendation [14-04], bluefin catch reports are sent to the Secretariat. **Table 18** and **19** summarizes the information available from the weekly and monthly catch reports (as of 16 September 2017), respectively.

3.4.6 Caging declarations

Caging declarations are submitted by farming Contracting Parties in compliance with Recommendations [06-07] and [14-04]. The caged amounts reported by different fleets and introduced into cages are shown in **Table 20**. Data shown represents data submitted up to 16 September 2017. Recommendation [11-20], which entered into force in June 2012, also requires CPCs to submit the amounts remaining in cages from the previous year, and Recommendation [06-07] requires a summary report of amounts farmed, as well as quantities marketed, mortalities and estimated growth.

3.4.7 Statistical Document Programme

Recommendations [01-21] and [01-22] track international trade of certain types of fish products of bigeye and swordfish, under the ICCAT statistical document programme. **Table 21** summarises the number of biannual reports (SD: statistical documents; RC: re-export certificates) received from ICCAT CPCs during the reporting period. **Table 22** and **Table 23** compares (swordfish and bigeye, respectively) current Task I nominal catch against trade statistics (SD's and RC's) received during the reporting period.

3.4.8 Transhipments

Recommendation 12-06, (replaced by Rec. 16-15) established a programme to monitor at-sea transhipments by large-scale longliners. The amounts transhipped are reported in **Table 24**. Note that there are many product types for which there are no conversion factors to a common weight unit.

3.4.9 Bluefin Tuna Regional Observer Program (ROP-BFT)

The data sets from this programme have been made available by the implementing consortium to the bluefin Working Group.

3.4.10 Bluefin Tuna Farming Operations

In 2014 the Secretariat presented a preliminary review of the size at harvest of bluefin from farming operations (Ortiz *et al.* 2015³). This information was already integrated into the ICCAT-DB system and was already used in the 2014 bluefin stock assessment (fully revised version of CAS/CAA estimations).

3.5 By-catch data

By-catch data is now submitted using the Observer data collection forms (ST09-NatObPrg). This has been covered in item 3.2 above. The ICCAT by-catch meta-database has been updated to the end of 2016 and uploaded to the ICCAT website for use by interested Parties (www.iccat.int/en/ByCatch.htm). These resources will facilitate the provision of by-catch data to the Working Groups for analysis.

3.5.1 Observer data

Forms were created in 2011 (Form CP45-ObsProg) to obtain information regarding the type of data collected by CPC national observer programmes. The Secretariat previously requested that only CPCs that have not previously completed this form or that have experienced changes in their observer programmes, not reflected in previous submissions, should submit this form in 2016. In 2017, however, the form was changed substantially to reflect the requirements stipulated in Rec. [16-14]. The form was significantly reduced, changed from a pdf to an Excel form and renamed CP45-NatObPrgsInf.xlsx. In 2017 submissions were received from El Salvador, the EU, Ghana, Iceland, Japan, Korea, Libya, Tunisia, Turkey and Venezuela (**Appendix 3**). Curaçao provided information in the older CP45-ObsProg.pdf form, while Mexico provided information in non-standard format.

In accordance with Recommendations 13-07 and 14-04, data collected under the national bluefin tuna observer programmes was also submitted to the Secretariat. For this reporting period it had been requested that this data be submitted using forms ST01-T1FC, ST02-T1NC, ST03-T2CE, ST06-T2FM. As such, this information is reported elsewhere in this document although some data has been submitted using the ST09-NatObPrg forms. The EU in particular (Cyprus, France, Greece, Italy, Malta and Portugal and Iceland) provided information from their bluefin tuna observer programmes using the ST09 forms.

3.6 FAD management plans

The *Recommendation by ICCAT on a Multi-Annual Conservation and Management Programme for Tropical Tunas* [Rec. 16-01] states that each year by 31 January, CPCs with purse seine and baitboat vessels fishing for bigeye, yellowfin and skipjack tunas in association with objects that could affect fish aggregation, including FADs, shall submit Management Plans for the use of such aggregating devices by vessels flying their flag to the Executive Secretary. The elaboration of the plan in Annex 6 provides an extensive list of criteria that must be included in the Plan.

Some of the requirements for the Plan are covered by the FAD data collection forms (ST08-FAD). Belize, Curaçao, Ghana and the EU have submitted FAD management plans for the reporting period.

4. Work in Support of the SCRS Intersessional Meetings

4.1 Bluefin tuna data preparatory meeting

The meeting was held in Madrid, Spain, 6-11 March. The major meeting objective was to revise all available data (catch, effort, CPUE, size and tagging) and review of all available life history information, in preparation for the Atlantic stock assessment session in July. The results of several updated analyses and cooperative efforts led by national scientists to gather and analyse data were presented, including the analysis of size data for the main fleets operating in the Atlantic and Mediterranean Sea. A comprehensive work plan on pending task between national scientist and the Secretariat was adopted to be complete prior to the assessment meeting.

³ Ortiz M., Justel-Rubio A. and Gallego J.L. 2015. Review and analyses of farm harvested size frequency samples of eastern bluefin tuna (*Thunnus thynnus*). ICCAT Coll. Vol. Sci. Pap. 71(2): 1018-1035.

4.2 Shortfin mako shark data preparatory meeting

The meeting was held in Madrid, Spain, 28-31 March. The major meeting objective was to revise all available data (catch, effort, CPUE, size and tagging) aiming for the Atlantic stock assessment session in June. The results of several updated analyses and cooperative efforts led by national scientists to gather and analyse data were presented, including the analysis of size data by sex and region for the main fleets operating in the Atlantic and a detailed review of all available life history information. The Shark Research and Data Collection Programme (SRDCP) was also reviewed and revised in light of several budgetary changes.

4.3 Atlantic swordfish data preparatory meeting

The meeting was held in Madrid, Spain (3-7 April). One of the major objectives of the meeting was to revise and improve whenever possible, all the existing fisheries and biological information (catches, catch & effort, CPUE, CATDIS, size samples, catch-at-size, and, conventional tagging) aiming to prepare the swordfish Atlantic stock assessment session in June. The work of Group permitted, among other achievements, to improve the overall catch series fisheries (unclassified gear catches are now residual), correct and recover important size samples of various CPCs, and improve the CPUE indices. A detailed work plan was adopted, scheduling the pending tasks and the intermediate work required by both the Secretariat and the national scientists, aiming to have all the conditions (input files, etc.) ready a few weeks prior to the stock assessment session.

4.4 Small Tunas species group intersessional meeting

The meeting was held at the University of Miami (24-28 April). The issues of substance dealt with were updating the Ecological Risk Assessment (ERA0, reviewing of appropriate approaches for future assessment of small tuna stocks, the status of SMTYP programme to improve collaboration among scientists and how the Atlantic Tropical tuna Tagging Program (AOTTP) could improve knowledge on small tuna populations.

The ERA conducted in 2016 was updated to include gear interactions of small tuna caught in the tuna longline and purse seine fisheries of the Atlantic Ocean. Wahoo and little tunny were the most vulnerable species, confirming previous conclusions of the Group about what stocks should be given high priority. The updated analysis using purse seine provides similar results to the longline results.

A variety of data limited approaches are available and it was agreed that best way to do this is to conduct Management Strategy Evaluation (MSE) to determine the best combination of data, assessment and control measures. MSE can also be used to determine the benefits of improving data collection and the value of new information, including that from the AOTTP. To do this the data rich North Atlantic albacore Operating Model (OM) is being used to simulate data poor time series and the results compared with data rich methods.

The Group reiterated that SMTYP should be a collaborative process, increasingly involving more scientists from all nations with major small tuna fisheries.

4.5 Meeting of the ICCAT Working Group on Stock Assessment Methods

The WGSAM met in Madrid (8-12 May) and the agenda covered a range of topics including intersessional progress made on CPUE standardization (primarily the inclusion of environmental covariates and the revision of the CPUE Table for Species Groups), Management Strategy Evaluation (MSE), and in implementing the Strategic Plan. Other matters included standardising the format of Executive Summaries, the Peer review of stock assessments and the ICCAT Software Catalogue.

An important development was the formation of Study Groups to promote Intersessional work. Study Groups will be identified by WGSAM members and to help address the objectives of the WGSAM as they pertain to the ICCAT Strategic 5 Year Plan. Two Study Groups were formed namely the Northern Albacore and MSE Study Group and the CPUE Standardization Study Group. Outcomes from this Group essential if the SRCS is to make progress on the Strategic Plan included streamlining the current CPUE table in order to reduce unnecessary discussions at future data preparatory meetings and agreement that the Northern

Albacore and MSE Study Group explore alternative candidate output graphics and summaries based on the Northern Albacore and MSE Study Group results, including those used by other RFMOs.

4.6 Albacore species group intersessional meeting (including stock assessment of Mediterranean Albacore)

The Group met in Madrid (5-12 June) in order to perform an assessment of Mediterranean Albacore and review the work done on the North Atlantic Albacore MSE.

A reliable assessment of Mediterranean albacore stock status is hindered by the inexistence (or low quality) of catch, catch-effort and size statistics over time for some important fleets. Although recent fishing mortality levels appear to be below F_{MSY} , and current biomass is approximately at B_{MSY} level unfortunately, due to the limited quantitative information available to the SCRS, there is considerable uncertainty about these results. Therefore catches should not be increased and possibly reduced until abundance trends are confirmed. The precise level of catch would depend on the level of risk the Commission would like to assume. If the downward abundance trends are confirmed, catch levels would need to be further reduced. As a prerequisite of successful assessments of the stock, a complete revision of Task I (aggregated catch, by gear/fleet) and Task II (catch-effort, size) data is recommended, specifically before the year 2000. The Committee believes that the total amount of removals is probably incomplete. To overcome this, the Group continues to recommend that CPCs make additional efforts to participate and be made aware of capacity building funds available for participation in and contributing to working group meetings.

An update of the MSE work conducted for northern albacore and presented at the 2017 WGSAM intersessional meeting was given. The Group agreed to present the MSE results also to the SWGSM whilst acknowledging that diagnostic tests are still being run and that the work will only be considered to have been completely reviewed by the SCRS after the plenary meeting.

4.7 Shortfin mako shark stock assessment session

The meeting was held in Madrid Spain, 12-16 June. The objective of this meeting was to assess the status of the stocks (North and South) of Atlantic shortfin mako shark. The last assessment was conducted in 2012. The populations were assessed using several models, from different types of surplus production models to fully integrated age-structured models. For the first time, projections of stock status were conducted for this species and management advice was provided based on Kobe strategy matrices. The assessment represented a significant step forward in the understanding of shortfin mako populations in the Atlantic Ocean.

4.8 Meeting of the Standing Working Group on Dialogue between Fisheries Scientists and Managers

The meeting was held in Madrid Spain, 29-30 June. The objectives of this meeting were to analyse of how management objectives have been established for priority stocks (tropical tunas, N-ALB, N-SWO and BFT); to inform on which performance indicators have been identified; and to report on the progress toward MSE/HCR development to date. The Secretariat provided an overview of the outcomes of the 2016 Joint Tuna RFMOs Working Group on Management Strategy Evaluation (MSE). Additionally, the Secretariat provided a summary of the work developed during the Joint Meeting of tuna RFMOs on the Implementation of the Ecosystem Approach to Fisheries Management, initiated by ICCAT and supported by the Common Oceans/ABNJ Tuna Project, which brought together scientists from the five t-RFMOs and national experts. The goals of the latter meeting were to (1) establish a sustained dialogue across t-RFMOs on the issues of EAF and its implementation, (2) understand common challenges in its implementation and (3) identify case specific solutions.

4.9 Atlantic swordfish stock assessment session

The meeting was held at the ICCAT Secretariat in Madrid (3-7 July) when both the North and South Atlantic stock were assessed. A peer review of the assessment was also undertaken by an external expert.

The South Atlantic stock was assessed using biomass dynamic state space models to allow for process error. The stock was estimated to be below B_{MSY} and so catches would need to be reduced to ensure that Commission objectives of maintaining the stock at a level that will support MSY.

The northern stock was assessed using both biomass dynamic state space models and SS. Both types of models agreed that overfishing is not occurring and biomass is either higher or very close to B_{MSY} . The results, however, are not entirely comparable with those obtained in the last assessment due to the incorporation of more data sources and updated information.

In 2016 the Commission agreed on a roadmap for the completion of MSE in support of the adoption of a harvest control rule for North Atlantic swordfish. This work started in 2017 and shall be completed by 2019 for a possible adoption of an HCR by the Commission.

4.10 Sub-Committee on Ecosystems intersessional meeting

The Sub-Committee on Ecosystems Intersessional meeting was held in Madrid, 10–14 July. The meeting included discussions on how to continue the progress made on the Ecosystems Approach to Fisheries Management within ICCAT including the outcomes of a joint tuna RFMO meeting held in Rome at the end of 2016. From a by-catch point of view the Secretariat presented a proposed revision to the ST09 observer data collection forms as well as a report card on submission of this data. An update to the assessment of the impact of ICCAT fisheries on sea turtles was presented resulting in a recommendation for sea turtle mitigation. The collaborative work amongst CPC scientists to assess seabird by-catch in the pelagic longline fleets operating in the South Atlantic and Indian Oceans was presented. It was noted this was complimentary to the ongoing work being conducted under the GEF-ABNJ funded Common Oceans Tuna Project. The Sub-committee also noted that several teleost fish species are caught as by-catch but not considered by other species groups and these species were noted for further attention.

4.11 Bluefin tuna stock assessment session

The meeting was held at the ICCAT Secretariat in Madrid (20- 28 July). Both the eastern and western stocks were assessed using a variety of models. In addition to substantial revisions to historical fishery data, new fishery-independent series of relative abundance, and new information on life history, a wide range of estimation models were applied to both stocks, including revised configurations of the virtual population analyses (VPAs), statistical catch-at-length, statistical catch-at-age and other integrated assessment models. Of these, the only models deemed to have progressed enough at the conclusion of the meeting to be considered as the basis of management advice were the VPA applications for the eastern stock and the VPA and Stock Synthesis applications for the western stock.

4.12 Tropical tuna species group intersessional meeting

The meeting was held in Madrid, Spain, 4-8 September 2017. The major meeting objectives were: a) review the current work and results of the AOTTP project up to day and make recommendations for the 2nd phase of this programme (catch, effort, CPUE, size and tagging) and, b) develop a work plan and actions in preparation for the MSE of tropical tuna species taking into consideration the assessment schedule of these species in coming years.

4.13 3rd Meeting of the Ad Hoc Working Group on FADs

The meeting was held in Madrid Spain, 11-12 September. The objectives of this meeting were to report on the work carried out following the recommendations issued by the Commission in 2016, assess the development in FAD-related technology and on the effect of FAD use on fishing mortality of stocks of tropical tunas. The Secretariat reported on the information on FAD provided by CPC's and issues related to the development of a common format to allow CPCs to submit data in a standardised way as required in Rec. 16-01.

This support from the Secretariat also included assistance in the coordination of the meeting documents and reports.

5. Infrastructure and technology

This year we have improved protection and availability or “business continuity” as a result of considerable improvements in the IT infrastructure of the ICCAT Secretariat i.e. two highly significant solutions in terms of improvement and protection of the IT infrastructure.

5.1 New back solutions implemented

5.1.1 Purchase of a local and remote backup of virtual machines

This solution consists of daily backup of the 23 virtual machines of the Secretariat.

There are two backup destinations.

- Local, housed in an NAS Synology RackStation RS815+, equipped with 4 disks each of 3.7 TB, 10.5 TB in total. This device stores security copies of the last 28 days of the virtual machines. The virtual machines can be recovered as well as specific files and/or directories contained in them.
- Remote, housed in the data processing center (DPC) of the service provider contracted. This service contains a replica of the last 5 backups of the virtual machines. The purpose is to have a copy of the virtual machines in the event of a physical problem with the DPC and/or the ICCAT Secretariat offices. We have technical assistance for startup of the virtual machines in the service provider's DPC, as well as for user access by the Secretariat.

5.1.2 Contracting of backup for the virtual server of the ICCAT website

The former backup of the ICCAT website server has been replaced by copying and restoring the server files. A new backup service has been contracted for the virtual machine of the server, which will enable restoration should the need arise, for example a management error, malicious code attack, etc. The restoration time, according to the information supplied by the provider, is approximately 2 hours. We receive daily an e-mail with the confirmation and data linked to the backup.

5.2 Purchase of a disk cabinet for the Secretariat's DPC

It is a NetApp FAS2520 HA (dual controller) storage system. It has 12 SAS disks of 900 GB providing 6.3 TB net. It uses the protocols iSCSI, CIFS and NFS. Each controller has 18 GB of memory, two 10 GB ports compatible with 1 GB, and another two of 1 GB.

This device has enabled independent storage of the Secretariat's virtual machines from the physical HP hosts where the virtualisation operating system VMWare is installed. This way, in the event of a failure of a physical server, the virtual machines can be changed (manually, for the time being) to another active physical host (pending the necessary memory expansion of the hosts).

Moreover, and as an additional measure to the recently implemented backup solution, this disk cabinet takes snapshots (security copies or images) of the virtual machines, every hour, daily, and the images are weekly. These can be used in the event of damage or corruption of the virtual machines.

The virtual machines of the Secretariat are concentrated in 3 VMWare hosts. All the virtual machines have been migrated from the individual storage of VMWare hosts to the NetApp storage cabinet.

A replica of each virtual machine is being made as an additional protective measure which is stored in the NetApp disk cabinet in the individual storage of each VMWare host. This applies to 18 virtual machines. We will add a replica of the 5 virtual machines of the VMS system.

5.3 Migration of communication lines

5.3.1 Migration of 3 fibre optic lines of 100/10 MB for 300 MB symmetrical lines

The 3 FTTH lines with a downloading speed of 100 MB and an uploading speed of 10 MB have been upgraded to 3 FTTH lines with a symmetrical speed of 300 MB for both data uploading and downloading.

Although the firewall only allows for 100 MB of data traffic, data uploading has improved and the capacity of 300 MB can be used when the firewall is upgraded.

5.3.2 Replacement of the old ADSL line with a 300 MB symmetrical optic fibre line – destination, external backup of virtual machines

This communication line has been migrated to dedicate it to the external backup traffic of the Secretariat's virtual machines. It has been securely configured to enable communication between the ICCAT DPC and that of the service provider.

Although the firewall only allows for speeds of 100 MB, it has been sufficient in supporting this service.

5.4 Software

5.4.1 Upgrade of VMWare virtualisation software from version 5.5 to 6

The operating system has been upgraded of the 3 VMWare hosts that support execution of the Secretariat's virtual machines i.e. two HP Proliant DL 380 servers: Gen 8 and Gen 9.

The operating system VSphere 5.5 Essentials 6 cpu has been migrated to its version 6.

The VCenter software which centrally manages the 3 hosts has also been upgraded to its version 6.

The growth in local virtualisation will be based on the increase in hardware resources of the 3 hosts, as well as improvement in VMWare licensing, which will allow for more functionality and high availability.

5.4.2 Increase in Symantec and Malwarebytes virus protection licenses

Due to the increase in devices, servers and work stations, we have had to purchase another 10 virus and malware protection licenses, making for a total of 80 licenses.

5.4.3 Upgrade of SDL Trados translation software and training for translators

Coinciding with the upgrade of the translators' computers, the SDL Trados Studio 2015 software has been upgraded to the 2017 version.

A course was given, through the manufacturer, on the new features and improvements of this latest version.

5.4.4 Upgrade of ArcGis software from version 10.3 to 10.5

The version of the ArcGis Desktop software has been upgraded from 10.3 to 10.5. The Windows server has also been upgraded to the latest version, Windows Server 2016 Standard.

5.5 Capacity increase of the data server for ownCloud meetings

The storage capacity of the ownCloud server offered by the ownCloud service <https://meetings.iccat.int> has been increased from 50 GB to 100 GB. The reason is because the initial 50 GB are occupied. The provider supplies a weekly security copy and the Secretariat has included the data of this service in its daily backup processes, with 28 days recovery (data of the meetings of the two previous years are also treated as historical information and stored accordingly.)

5.6 Migration and integration of the AOTTP server

The virtual server of the AOTTP programme has been migrated and integrated into the virtualized servers of the ICCAT Secretariat.

5.7 Trials with automatic patching software and server vulnerabilities analysis

Trials have been carried out for patching operating systems and applications on servers using automatic patch searches. Trials have also been carried out for analysis of vulnerabilities on servers. It is intended to study how to begin strengthening servers / services on the Secretariat's local network.

The trials have been successful. GFI Languard software was used.

5.8 Cleaning and donation of old hardware and software

Hardware that was old, damaged and/or in disuse, as well as old software has been located and donated. This task has allowed for more space and for the Secretariat to only house the hardware and software that is in use. This is an ongoing task.

5.9 Cloud Computing

An increasing large number of intersessional and computer intensive tasks have to be undertaken by SCRS Working Groups. During 2015 the ICCAT cloud-computing servers (<http://meetings.iccat.int>) were used for conducting the work of the Data Preparatory and Stock Assessment meetings; i.e. for hosting data sets, collaborating on analyses, dissemination of SCRS papers, and drafting reports. <http://rscloud.iccat.int> was used for computer intensive tasks. For example to provide advice in the Kobe Advice Framework requires the use of simulation to obtain the probabilities of stock status under different management options. The cloud was also used to conduct Management Strategy Evaluation (MSE) for North Atlantic albacore to test Harvest control rules and develop limit reference points; and to generate data sets such as catch-at-size and age and EffDis (e.g. <http://134.213.29.249/effdis>). The cloud is also being used to make the stock assessment results available (<http://rscloud.iccat.int/kobe/>) The Github repository is being used to host the Albacore and Bluefin MSE code, the ICCAT software catalogue, and the ICCAT GBYP meta-DB, see (<https://github.com/iccat/>).

The Owncloud web server has now been used for two years by the SCRS and certain Commission meetings to share information, data, documents and models required to facilitate the work of the various groups and panels. The Secretariat has provided access details in advance of the meetings, to registered participants, so that they can access the necessary information prior to the commencement of the meetings. In several instances, the Secretariat has been requested to provide access details to non-participants. As there is currently no protocol regarding the provision of access details, the Secretariat would like to clarify the procedures with the SCRS.

6. Publications

6.1 ICCAT series of periodic publications

For the current year, the Secretariat has continued the series of periodic publications developed throughout the history of ICCAT. **Table 25** shows the volumes of these series that were published in 2016.

Since 2010, the paper versions of Volumes 1 and 2 of the Biennial Report are published in colour to facilitate the visualization and interpretation of the graphic representations.

Volume 4 of the Biennial Report was published for the first time in 2011. This Volume contains the reports generated by the Secretariat for the SCRS and the Commission, such as the Secretariat Report on Statistics and Coordination of Research, the Financial and Administrative Reports, and the ICCAT Secretariat Reports to the Conservation and Management Measures Compliance Committee (COC) and the Permanent Working Group for the Improvement of ICCAT Statistics and Conservation Measures (PWG).

Since 2013, the publication of the Statistical Bulletin, which is available in hardcopy and electronic version since 2011, is now biennial. Thus, each volume of the Bulletin will have two parts corresponding to consecutive years. Due to the request from the Commission to reduce costs, the Statistical Bulletin will only be published in electronic format.

Given that the workload that the publication of the ICCAT Collective Volume of Scientific Papers involved for the Secretariat, due to the fact that most of the papers submitted did not follow the publication guidelines supplied, in 2014 the SCRS agreed that those papers which did not meet a minimum standard would not be published. On this basis, this year the list of papers not included in the published volume includes papers withdrawn by the authors and papers which failed to meet the minimum standard established. The latter, if the SCRS so agrees, may be made available on the ICCAT web site in their original format. Following the SCRS request to reduce the time of publication, the Secretariat adopted the necessary measures to ensure the documents are published in electronic format within a short period after the Sub-committees and Species Group meetings. Accordingly, in 2017 the Secretariat published Volumes 73 (a total of 9 issues) and 74 (2 issues published already) of the ICCAT Collective Volume of Scientific Papers. Due to the request from the Commission to reduce costs, from now on the ICCAT Collective Volume of Scientific Papers will only be published in electronic format.

The Secretariat will continue to work on developing software which facilitates editing work undertaken by the Secretariat to maintain the current quality standard of the publications.

6.2 ICCAT- Aquatic Living Resources (ALR) Agreement

In 2007, ICCAT signed an agreement with ALR aimed at providing greater dissemination of the work of the SCRS within the scientific community. This agreement meant the development of a thematic section on tunas in the journal, to include documents presented to the SCRS and selected by the SCRS to be inserted in this section. Since that date, six volumes of the journal have been published with this section and a total of 24 ICCAT documents. However, in 2014 ALR has changed its editorial line towards an ecosystem approach of fisheries management, which considerably reduces the possibilities of publishing the documents presented to the SCRS.

In 2015, the former ALR editor, Dr. Brigitte Milcendon, informed the Secretariat that ALR would continue as a peer-reviewed journal, with a new editing team and without the participation of IFREMER in the publication. Dr. Milcendon also expressed the new team's will to maintain the agreement with ICCAT. The field of interest of the journal in its new phase will continue to have an ecosystem approach, but with a broader outlook than in its last phase, which will open the publication up to a larger number of SCRS documents. In 2016 the Secretariat contacted the new ALR editorial team, whom reiterated their willingness to enhance the collaboration with ICCAT and requested a greater involvement of the SCRS in the process of selection, review and publication of the documents, through an Editorial Committee. On the other hand, ALR expressed their willingness to publish a few more ICCAT papers (12-15) on an annual basis. However, in 2016 only 2 papers were selected by the Sub-committees Conveners and Species Group Rapporteurs as of potential interest for publication the ALR. Based on such fact, which precludes ALR to annually have an ICCAT issue, the Secretariat, together with the SCRS Chair, will present an alternative option.

6.3 ICCAT Manual

In 2017, no new requests have been made regarding the Manual.

6.4 ICCAT Web site

The ICCAT web site, in the three official languages of the Commission, continues to be updated on a regular basis to provide better service to users.

In 2016, the static content of the web site is being made dynamic, including databases and making searches easier and more extensive. Furthermore, the Secretariat is developing a new and improved web site which will have a new structure and will be accessible and more functional from different mobile devices, tablets and portable computers. The new ICCAT webpage shall be presented at the 2017 Commission meeting.

7. International activities

7.1 Coordinated Working Group on Fishery Statistics (CWP)

Due to scheduling conflicts between SCRS intersessional meetings and the CWP meeting, no Secretariat staff was able to attend the CWP meeting in 2017.

7.2 Monitoring system for fishery resources (FIRMS)

In 2017, the Secretariat updated the species identification sheets for yellowfin tuna, north and south albacore, east and west sailfish, and Mediterranean swordfish populations which were assessed by the SCRS in 2016.

7.3 ASFA

Since the last SCRS meeting, the Secretariat has prepared the entries for the *Aquatic Sciences and Fisheries Abstracts* (ASFA-Proquest) database of the papers published in issues 3, 4 and 5 and issue 1 and 2 of Volumes 68 and 69 of the ICCAT Collective Volume of Scientific Papers, respectively.

7.4 iMarine

The iMarine initiative is an open and collaborative initiative aimed at supporting the implementation of the Ecosystem Approach to fisheries management and the conservation of living marine resources. The Secretariat attended an online seminar entitled iMarine Support to Tuna Atlas; from scattered Data to integrated Indicators and SmartForms prototype for Mobile Data Collection of on-Board Scientific Observers Data. The Secretariat remains a member of the iMarine extended board.

8. ICCAT Scientific programmes

The activities of the ICCAT Atlantic-Wide Bluefin Research Programme (ICCAT GBYP), the Enhanced Research Programme for Billfish (ERPB), ICCAT Year Research Programme for Small Tunas (SMTYP), the Shark Research and Data Collection Programme (SRDCP), the and the Atlantic Ocean Tropical tuna Tagging Programme (AOTTP) are separately presented in reports to the SCRS (see SCI-037, SCI-038, SCI-039, SCI-040 and SCI-041, respectively). The Secretariat's participation in these programmes mainly consists in administrative and scientific support. In the administrative area the Secretariat provides assistance with the coordination of research proposals calls, funds administration and oversee of auditory and accounting responsibilities of these programmes. In the scientific support the Secretariat has a major role between the SCRS and the programme coordinator for the design of research proposals, call for tenders, evaluation of proposals, coordination of research and database management, as well as IT support to each of the programmes. As in the past, during 2016 the Secretariat actively participated in several of the research programmes components.

9. Other activities

9.1 1st Joint T-RFMO Fad Working Group Meeting

During the last meeting of the Kobe process Steering Committee, it was also noted that the European Union offered to finance a joint tuna-RFMO meeting and that some additional funding could be obtained from the Common Oceans/ABNJ Tuna Project. Accordingly, during 2016 the tuna-RFMO Secretariats held discussions regarding the possibility of holding a joint tuna RFMO meeting on FAD fishing issues, sometime in 2017. ICCAT was mandated to organize such a meeting, and an agreement was achieved between ICCAT, IOTC and IATTC, to hold the First Joint Tuna-RFMO FAD Working Group meeting in Madrid, 19-21 April 2017. It should be noted that WPCFC has decided not to participate in this meeting. The main objective of the meeting was to promote discussions on tropical tuna FAD fishing and management of relevant issues on an Ocean-wide perspective.

In total, 35 Contracting Parties, namely Belize, Colombia, Costa Rica, Côte D'Ivoire, Ecuador, El Salvador, European Union, Gabon, Ghana, Guatemala, Equatorial Guinea, Honduras, Indonesia, Islamic Republic of Iran, Japan, Kenya, Liberia, Mauritius, Mexico, Mozambique, Nicaragua, Nigeria, Pakistan, Peru, Republic of Maldives, Sao Tomé & Principe, Senegal, Somalia, Sri Lanka, Sultanate of Oman, Thailand, Tunisia, U.K. (O.T.), United States and Venezuela. Also in attendance were 8 non-governmental organisations and entities, namely Greenpeace, IPNLF (the International Pole & Line Foundation), ISSF (International Seafood Sustainability Foundation), MSC (Marine Stewardship Council), PEW Charitable Trusts, SFP (Sustainable Fisheries Partnership), TRI MARINE, and WWF (World Wildlife Fund).

9.2 Collaboration with ISSF

The International Seafood Sustainability Foundation (ISSF) continues providing the Secretariat with detail catch (by vessel trip, species and commercial size category) for all purchases made ISSF-participating companies. These correspond to unloading of Atlantic catches from tropical tunas (bigeye, yellowfin, skipjack) and albacore to canning plants around the world. This information has previously been used by the SCRS scientists to complement and improve the Ghanaian Task II statistics. It has been noted that the submissions have been made in a diverse range of formats. As such, ISSF agreed in 2015, to look into standardising the data submissions. As such, the data received are still being stored by ICCAT, but have not been made available for use to the SCRS at this stage.

9.3 CITES

In 2017 ICCAT representatives from ICCAT (SCRS Chair and Sharks species group chair) attended a meeting entitled "The Cooperation on implementing CITES for marine species: achievements, lessons learned and future opportunities" that was held in Geneva, Switzerland from the 13-15 March 2017. This continued the beneficial cooperation established between ICCAT and CITES in recent years.

9.4 ICES

Considering the fruitful experience ICCAT and ICES have had in recent years with regard to scientific collaboration, there is the willingness of both organisations to strengthen this cooperation and explore new initiatives and discussions have commenced between the Secretariats. It has been agreed therefore that it is appropriate and desirable to improve collaboration between ICCAT SCRS-ICES, particularly in the areas of by-catch and sharks issues, through our Sub-committee on Ecosystems and by-catch and the Shark species group. Specifically, it would be convenient to keep the participation of ICES scientific experts in ICCAT shark stock assessments and vice versa. It is envisioned that following the joint ICCAT/ICES training courses that have been held in the past, ICCAT could continue to work with ICES on areas of capacity building.

9.5 FAO- Common Oceans ABNJ Tuna Project

At the 2015 ICCAT commission meeting, it was decided to continue to cooperate with this programme provided that there are benefits to ICCAT. To this end, since the previous SCRS plenary, the ICCAT Secretariat has participated in several ABNJ Common Oceans initiatives. These include participation in the following meetings that were funded or partially funded by the project:

1. Joint tuna RFMO MSE meeting held at the Secretariat office, Madrid (1-3 November 2016)
2. Joint Meeting of tuna RFMOs on the Implementation of the Ecosystem Approach to Fisheries Management, which took place in FAO HQ in Rome, Italy (12-14 December 2016).
3. 1st Regional Seabird By-catch Pre-assessment Workshop held at the Kruger Park, South Africa (23 February – 1 March 2017)
4. Tuna compliance network meeting held in Vigo, Spain (27-31 March 2017)
5. 1st Joint T-RFMO FAD Working Group Meeting, held in Madrid Spain (19-21 April 2017)

In addition, ICCAT has been coordinating a Feasibility study on the development of an online reporting system. This includes both a feasibility study to determine the resources, costs, technologies required to implement an online reporting system, as well as the production of a demo online reporting tool. Due to the requirements of the ABNJ project, this study and demo are generic and could potentially be applied across the tuna RFMOS.

ICCAT also made several proposals to the GEF-ABNJ steering committee for future collaborations. Unfortunately, once again, ICCAT's attempts to increase collaboration with the project were not particularly successful. Nevertheless, proposals were made regarding:

1. Proposal for the 1st meeting of the Technical Working Group on FADs and a 2nd Joint T-RFMO FAD Working Group Meeting
2. Proposed meeting of the tRFMO MSE Working Group (and associated activities)
3. To lead and coordinate an Ecosystem Component: Common oceans ABNJ tuna project, including a follow up meeting to that held in December 2016.
4. Capacity Building Workshops on Compliance issues.

Further information regarding ICCAT's involvement in the GEF-Common Oceans ABNJ Tuna Project are provided in document SCI-094.

10. ICCAT funds for data improvement and capacity building

To improve data collection and strengthen the capacity of the scientists from some developing Parties, the Japanese Government created an initial data improvement project which was continued, in a second phase, by the ICCAT/Japan Data and Management Improvement Project (JDMIP) and since December 2014, in a third phase, with the ICCAT/Japan Capacity-Building Assistance Improvement Project (JCAP) (the report is contained in document SCI-009).

Besides this project, there is also a Data Fund, which was established through the *Resolution by ICCAT on Improvements in Data Collection and Quality Assurance* [Res. 03-21]. The Data Fund is open to voluntary contributions from the Contracting Parties. To date, only the United States has contributed to this fund.

The European Union and the United States created their own capacity building funds for data collection and analysis of data and stock assessment methods, as well as to facilitate participation in SCRS meetings.

In 2014, the Commission adopted the *Recommendation by ICCAT amending Recommendation [11-26] on the Establishment of a Meeting Participation Fund for Developing Contracting Parties* [Rec. 14-14], for the participation to both the SCRS and Commission meetings.

In 2013, the Commission adopted the *Recommendation by ICCAT on the Establishment of a Scientific Capacity Building Fund for Developing States which are ICCAT Contracting Parties* [Rec. 13-19] which establishes a Special Capacity Building Fund (SCBF) to support scientists from ICCAT Contracting Parties, which are developing States regarding their need to acquire knowledge and develop capacities in ICCAT related issues.

En 2017 se ha creado un fondo financiado en un 80% por la Unión Europea cuya finalidad es desarrollar un proyecto entre los científicos ghaneses y del IRD con el fin de finalizar el desarrollo del software T3+ necesario para el tratamiento global de las estadísticas de Ghana (TRO).

In 2012, the SCRS approved a protocol to use the Data Fund and other ICCAT funds. This protocol defines a broad structure for use of the funds which includes improvement of statistics, training and support of SCRS work, including attendance at meetings. The protocol also includes the criteria to be followed for allocation of funds.

On the basis of this protocol, in 2017 the funds have been used as follows:

- Participation at SCRS meetings: 52 scientists from Algeria, Brazil, Côte d'Ivoire, Liberia, Mauritania, Mexico, Morocco, Namibia, Nigeria, São Tomé and Príncipe, Senegal, South-Africa, Tunisia, Uruguay and Venezuela, were funded to attend the SCRS scientific meetings.
- Improvement of statistics: Training course on capacity building of data collection in the semi-industrial, artisanal and recreational fisheries in Liberia and restructuring and recovery of the statistical system in São Tomé and Príncipe (supported by JCAP).

-
- Support to the SCRS work: At its 2016 meeting, the Commission approved a specific budget to support the SCRS, charged to the ICCAT Working Capital Fund. The activities financed have been the following: the code migration, which started in 2014 with the vessel database, the numerous applications which interact with various databases of the ICCAT-DB system; peer revision and/or expert for the Atlantic swordfish; Shark Research and Data Collection Programme (SRDCP); and Small Tunas Tagging Programme.

11. Major Tasks on statistics planned for 2017

During 2017, the Secretariat undertook an exhaustive work plan in terms of statistical related tasks, aiming to complete all the major SCRS demands and priorities for 2017. A reasonable part of the priority tasks were finalised in a timely manner, and the outcome used by the SCRS during 2017. However, several ongoing priority projects (RDBMS migration to MS-SQL server 2016, ICCAT-DB documentation framework, full revision of the tagging database system, improvements on the GIS system - shape files update, statistical databases deployment on the ICCAT cloud, etc.) have been partially implemented and in some cases postponed for 2018. It is important to note that, those postponed projects had no negative impact on the accomplishments of the SCRS requirements for 2017.

The JAVA project which was initiated in 2015 (two years) was finalised and all the development made (unattended data integration software, web-form prototyping, ICCAT-DB improvements in structure and automation tools, improvement of various applications) was fully incorporated into the ICCAT-DB system. This required extensive coding due to the complexity of the projects. The Secretariat has also undertaken additional training in JAVA technologies (however, not sufficient) aiming to maintain and continue the development of applications as well as other resources and tools for the maintenance of the ICCAT databases. Significantly, a database programming expert was added to the ICCAT Secretariat in late 2017, and therefore these applications will receive the development required to continue their functionality and plan important improvements into the future.

The Secretariat has also begun work on addressing the Commission's request to provide the possibility for online reporting information. The Secretariat has already begun to develop tools to provide this possibility for the statistical data reporting forms. However, to extend this work to all the ICCAT reporting requirements is an extremely large undertaking that requires time and resources not currently available at the Secretariat. The work has been conducted internally within the Secretariat and, to a degree, in collaboration with the GEF-Common Oceans ABNJ Tuna Project, as mentioned in item 9.5 above. The Secretariat is also working with the ICCAT Online Reporting Working Group to ensure the various initiatives are coordinated and planned. The Online Reporting Working Group has primarily corresponded electronically. However, a physical meeting was also attended by members of the Secretariat staff.

12. Secretariat staff and organization

In 2017 Mr. Carlos Mayor joined the scientific staff at the Secretariat as a Data Base Programmer. Detailed information on the structure and the Secretariat staff is available on the ICCAT web site (www.iccat.int/).

Figure 2. Number of VMS signals received from vessels authorised to fish bluefin tuna in the period 2016/09/17-2017/10/13. Aggregated information by 1 degree squares for the Mediterranean Sea. The data does not contemplate positions in port (according to the integrated algorithm).

Figure 2. Nombre de signaux VMS reçus de navires autorisés à pêcher du thon rouge entre le 17 septembre 2016 et le 13 octobre 2017. Information agrégée en carrés de 1 degré pour la mer Méditerranée. Les données ne tiennent pas compte des positions au port (selon l'algorithme intégré).

Figura 2. Número de señales de VMS recibidas de buques autorizados a pescar atún rojo en el periodo 2016/09/17-2017/10/13. Información agregada por cuadrículas de 1 grado para el mar Mediterráneo. Los datos no consideran las posiciones en puerto (según el algoritmo integrado).

APPENDIX 1 /Appendice 1 / Apéndice 1

Appendix 1. Standard SCRS catalogues on statistics (Task-I and Task-II) of the 13 major ICCAT species (10 tuna & tuna like species and 3 shark species) by stock, major fishery (flag/gear combinations ranked by order of importance) and year (1996 to 2016). Only the most important fisheries (representing ±97.5% of Task-I total catch) are shown. For each data series, Task I (DSet= “t1”, in tonnes) is visualised against its equivalent Task II availability (DSet= “t2”) scheme. The Task-II colour scheme, has a concatenation of characters (“a”= T2CE exists; “b”= T2SZ exists; “c”= CAS exists) that represents the Task-II data availability in the ICCAT-DB. See the legend for the colour scheme pattern definitions.

Appendice 1. Catalogues standards du SCRS sur les statistiques (Tâche I et Tâche II) des 13 espèces principales de l'ICCAT (10 espèces de thonidés et espèces apparentées et 3 espèces de requins) par stock, pêcherie principale (combinaisons pavillon-engin classées par ordre d'importance) et année (1996 à 2016). Seules les pêcheries les plus importantes (représentant +/- 97,5% de la prise de Tâche I) sont présentées. Chaque série de données de la Tâche I (DSet= “t1”, en tonnes) est représentée par rapport au schéma de disponibilité équivalent de la Tâche II (DSet= “t2”). Le schéma de couleurs de Tâche II présente une concaténation de caractères (“a”= T2CE existe; “b”= T2SZ existe; “c” = CAS existe) qui représente la disponibilité des données de Tâche II dans la base de données de l'ICCAT. Veuillez vous reporter aux légendes pour les définitions du schéma de couleurs.

Apéndice 1. Catálogos estándar del SCRS sobre estadísticas (Tarea I y Tarea II) de las 13 especies principales de ICCAT (10 especies de túnidos y especies afines y 3 especies de tiburones) por stock, pesquería principal (combinaciones arte/pabellón clasificadas por orden de importancia) y año (199 a 2016). Solo se muestran las pesquerías más importantes (que representan ±97,5% de la captura total de Tarea I). Cada serie de datos de Tarea I (DSet= “t1”, en t) se visualiza con respecto a su esquema equivalente de disponibilidad de Tarea II (DSet= “t2”). En el esquema de colores de Tarea II, se incluye una concatenación de caracteres (“a”= T2CE existe; “b”= T2SZ existe; “c”= CAS existe) que representa la disponibilidad de datos de Tarea II en la base de datos de ICCAT. Véase la leyenda para las definiciones del patrón del esquema de colores.
